Randomly perturbed graphs

Based on

- Smoothed analysis [Spielman and Teng]
- Diameter of a cycle plus a random matching [Bollobás and Chung]
- How many random edges make a dense graph Hamiltonian?
 [Bohman, Frieze, and Martin]

ヘロト 人間 ト ヘヨト ヘヨト

A proposed approach for real-world graphs

Theorems that hold for

a sufficiently arbitrary graph and a sufficiently small perturbation

should be valid predictions for real-world networks.

・ 同 ト ・ ヨ ト ・ ヨ ト ・

Example

Theorem

Let \overline{G} be any connected *n*-graph, and let $R \sim \mathbb{G}_{n,\epsilon/n}$. Then, with high probability, $G = \overline{G} + R$ has

$$\mathsf{diam}(G) = \mathcal{O}\left(\epsilon^{-1} \log n\right).$$

Introduction Expansion Expansion in the real world Expansion in randomly perturbed graphs

◆□> ◆□> ◆豆> ◆豆> ・豆 ・ のへで

Proof if $R \sim \mathbb{G}_{1-\text{out}}$ then *G* is expander

Abraham D. Flaxman Expansion in Perturbed Graphs

How do you prove that a *k*-out is an expander, for large *k*?

イロト 不得 トイヨト イヨト

How do you prove that a *k*-out is an expander, for large *k*?

$$\mathbb{P}\left[\exists S: \boldsymbol{e}(S,\overline{S}) \leq \delta \cdot |S|\right] \leq \sum_{\ell} \binom{n}{\ell} \mathbb{P}\big[\boldsymbol{e}(S,\overline{S}) \leq \delta\ell\big] = \boldsymbol{o}(1).$$

イロト 不得 トイヨト イヨト

How do you prove that a *k*-out is an expander, for large *k*?

$$\mathbb{P}\left[\exists S: \boldsymbol{e}(S,\overline{S}) \leq \delta \cdot |S|\right] \leq \sum_{\ell} \binom{n}{\ell} \mathbb{P}\big[\boldsymbol{e}(S,\overline{S}) \leq \delta\ell\big] = \boldsymbol{o}(1).$$

This doesn't work unless k is a large enough constant. (And it shouldn't, since it's not true for k = 1.)

Curious extension of these techniques

Conclusion

Abraham D. Flaxman Expansion in Perturbed Graphs

ヘロト 人間 とくほとくほとう

Conclusion

- Real-world graphs are interesting
- Randomly perturbed graphs can model them
- Doesn't make a prediction on expansion
- This is consistent with the data

くロト (過) (目) (日)
