# Reiterated Homogenization in $B V$ via Multiscale Convergence 

Rita Ferreira<br>I.C.T.I. - Carnegie Mellon | Portugal, F.C.T./C.M.A. da U.N.L.<br>Quinta da Torre, 2829-516 Caparica, Portugal<br>rferreir@andrew.cmu.edu, ragf@fct.unl.pt<br>Irene Fonseca<br>Department of Mathematical Sciences<br>Carnegie Mellon University, Pittsburgh, PA 15213, USA<br>fonseca@andrew.cmu.edu

#### Abstract

Multiple-scale homogenization problems are treated in the space $B V$ of functions of bounded variation, using the notion of multiple-scale convergence developed in [35]. In the case of one microscale Amar's result [3] is recovered under more general conditions; for two or more microscales new results are obtained.

AMS Classification Numbers (2010): 49J45, 35B27, 26A45
Key Words: periodic homogenization, multiscale convergence, linear growth, space $B V$ of functions of bounded variation, $B V$-valued measures, $\Gamma$-convergence

## 1. Introduction and Main Results

Here we are concerned with the study of mathematical problems within the framework of homogenization theory, which addresses the description of the macroscopic or effective behavior of a microscopically heterogeneous system. There are multiple applications in the fields of physics, mechanics and engineering sciences, from which we emphasize problems aimed at the modeling of composites, stratified or porous media, finely damaged materials, or materials with many holes or cracks.
From the mathematical point of view, homogenization is often associated to the study of the asymptotic behavior of oscillating partial differential equations, or of minimization problems yielding from certain oscillating functionals, depending on one or more small-scale parameters. Several approaches have been proposed to handle this type of problems, such as the method of asymptotic expansions (see the books of Bensoussan, Lions and Papanicolaou [11], Jikov, Kozlov and Olĕ̆nik [39], Bakhvalov and Panasenko [10], and Sanchez-Palencia [47]) and methods using the concepts of $G$-convergence due to Spagnolo (see Spagnolo [49] and De Giorgi and Spagnolo [29]), H-convergence due to Murat and Tartar (see Murat and Tartar [43], Tartar [50] and Murat [42]), $\Gamma$-convergence due to De Giorgi (see De Giorgi and Dal Maso [27] and De Giorgi and Letta [28]), and two-scale convergence due to Nguetseng (see [44]), further developed by Allaire [1] and Allaire and Briane [2]. For a comprehensive introduction to the theory of homogenization and for an overview of the different homogenization methods, we refer to the book of Cioranescu and Donato [23].
In [3] Amar extended the notion of two-scale convergence to the case of bounded sequences of Radon measures with finite total variation, which was then used to study the asymptotic behavior of sequences of positively 1homogeneous and periodically oscillating functionals with linear growth, defined in the space $B V$ of functions of bounded variation. Precisely, the following result is given in [3].

Theorem A (cf. [3, Thm. 4.1]). Let $\Omega \subset \mathbb{R}^{N}$ be an open and bounded set with $\partial \Omega$ Lipschitz, let $Y:=(0,1)^{N}$,
and let $f: \mathbb{R}^{N} \times \mathbb{R}^{N} \rightarrow[0, \infty)$ be a function such that
(A1) for all $\xi \in \mathbb{R}^{N}, f(\cdot, \xi)$ is continuous and $Y$-periodic;
(A2) for all $y \in Y, f(y, \cdot)$ is convex, positively 1-homogeneous, and of class $C^{1}\left(\mathbb{R}^{N} \backslash\{0\}\right)$;
(A3) there exists a constant $C>0$ such that for all $y \in Y, \xi \in \mathbb{R}^{N}, \frac{1}{C}|\xi| \leqslant f(y, \xi) \leqslant C|\xi|$.
For each $\varepsilon>0$, let $I_{\varepsilon}: B V(\Omega) \rightarrow \mathbb{R}$ be the functional defined by

$$
I_{\varepsilon}(u):=\int_{\Omega} f\left(\frac{x}{\varepsilon}, \frac{\mathrm{~d} D u}{\mathrm{~d}\|D u\|}(x)\right) \mathrm{d}\|D u\|(x)+\int_{\Omega}|v(x)-u(x)|^{p} \mathrm{~d} x
$$

where $v \in L^{N /(N-1)}(\Omega), p \in(1, N /(N-1)]$ if $N>1$, and $p \in(1, \infty)$ if $N=1$, and $\mathrm{d} D u / \mathrm{d}\|D u\|$ represents the Radon-Nikodym derivative of $D u$ with respect to its total variation $\|D u\|$. Then for each $\varepsilon>0$, there exists a unique $u_{\varepsilon} \in B V(\Omega)$ such that

$$
I_{\varepsilon}\left(u_{\varepsilon}\right)=\min _{w \in B V(\Omega)} I_{\varepsilon}(w)=\inf _{w \in W^{1,1}(\Omega)}\left\{\int_{\Omega} f\left(\frac{x}{\varepsilon}, \nabla w(x)\right) \mathrm{d} x+\int_{\Omega}|v(x)-w(x)|^{p} \mathrm{~d} x\right\}
$$

Moreover, there exist $u \in B V(\Omega)$ and $\boldsymbol{\mu} \in \mathcal{M}\left(\Omega ; B V_{\#}(Y)\right)^{\dagger}$ such that $\left\{u_{\varepsilon}\right\}_{\varepsilon>0}$ weakly-夫 converges to $u$ in $B V(\Omega)$ as $\varepsilon \rightarrow 0^{+}$and, up to a subsequence, $\left\{D u_{\varepsilon}\right\}_{\varepsilon>0}$ two-scale converges to the measure on $\Omega \times Y$, $\lambda_{u, \mu}:=D u \mathrm{~d} y+D_{y} \boldsymbol{\mu}$ as $\varepsilon \rightarrow 0^{+\dagger \dagger}$. Furthermore,

$$
\lim _{\varepsilon \rightarrow 0^{+}} I_{\varepsilon}\left(u_{\varepsilon}\right)=\inf _{\substack{w \in B V(\Omega) \\ \boldsymbol{\nu} \in \mathcal{M}(\Omega ; B V \#(Y))}} I^{\mathrm{sc}}(w, \boldsymbol{\nu})=I^{\mathrm{sc}}(u, \boldsymbol{\mu}),
$$

where $I^{\text {sc }}$ is the two-scaled homogenized functional defined for $w \in B V(\Omega)$ and $\boldsymbol{\nu} \in \mathcal{M}\left(\Omega ; B V_{\#}(Y)\right)$ by

$$
I^{\mathrm{sc}}(w, \boldsymbol{\nu}):=\int_{\Omega \times Y} f\left(y, \frac{\mathrm{~d} \lambda_{w, \boldsymbol{\nu}}}{\mathrm{~d}\left\|\lambda_{w, \boldsymbol{\nu}}\right\|}(x, y)\right) \mathrm{d}\left\|\lambda_{w, \boldsymbol{\nu}}\right\|(x, y)+\int_{\Omega}|v(x)-w(x)|^{p} \mathrm{~d} x
$$

Finally, in the minimizing pair $(u, \boldsymbol{\mu})$ the function $u \in B V(\Omega)$ is uniquely determined.
The proof of Theorem A is based on the so-called two-scale convergence method, which has the virtue of taking full advantage of the periodic microscopic properties of the media, enabling the explicit characterization of the local behavior of the system: The asymptotic behavior as $\varepsilon \rightarrow 0^{+}$of the energies $F_{\varepsilon}$ and of the respective minimizers $u_{\varepsilon}$ is given with regard to both macroscopic and microscopic levels, through the two space variables $x$ (the macroscopic one) and $y$ (the microscopic one), and through the two unknowns $u$ and $\boldsymbol{\mu}$. The next step of the two-scale convergence method is to obtain the effective or homogenized problem, that is, the limit problem only involving the macroscopic space variable $x$, and which has as solution the function $\bar{u}(x):=\int_{Y} u(x, y) \mathrm{d} y$. This is usually done via an average process with respect to the "fast variable" $y$ of the two-scale homogenized problem.
For the class of functions $f$ considered by Amar [3], Theorem A provides an alternative characterization of the homogenized problem previously obtained by Bouchitté [13], [14], and summarizes as follows:

Theorem B (cf. [13, Thm. 2.1]). Let $\Omega \subset \mathbb{R}^{N}$ be an open and bounded set, let $Y:=(0,1)^{N}$, and let $f: \mathbb{R}^{N} \times \mathbb{R}^{N} \rightarrow \mathbb{R}$ be a function such that
(B1) for all $\xi \in \mathbb{R}^{N}, f(\cdot, \xi)$ is measurable and $Y$-periodic;

[^0](B2) for all $y \in Y, f(y, \cdot)$ is convex;
(B3) there exists a constant $C>0$ such that for all $y \in Y, \xi \in \mathbb{R}^{N}, \frac{1}{C}|\xi|-C \leqslant f(y, \xi) \leqslant C(1+|\xi|)$.
For each $\varepsilon>0$, let $F_{\varepsilon}: L^{1}(\Omega) \rightarrow(-\infty, \infty]$ be the functional defined by
\[

F_{\varepsilon}(u):= $$
\begin{cases}\int_{\Omega} f\left(\frac{x}{\varepsilon}, \nabla u(x)\right) \mathrm{d} x & \text { if } u \in W^{1,1}(\Omega), \\ \infty & \text { otherwise. }\end{cases}
$$
\]

Then, the sequence of functionals $\left\{F_{\varepsilon}\right\}_{\varepsilon>0} \Gamma$-converges as $\varepsilon \rightarrow 0^{+}$with respect to the strong topology of $L^{1}(\Omega)$ to the functional $F_{0}: L^{1}(\Omega) \rightarrow(-\infty, \infty]$ given by

$$
F_{0}(u):= \begin{cases}F^{\mathrm{h}}(u) & \text { if } u \in B V(\Omega), \\ \infty & \text { otherwise },\end{cases}
$$

where, for $u \in B V(\Omega)$,

$$
F^{\mathrm{h}}(u):=\int_{\Omega} f_{\mathrm{hom}}(\nabla u(x)) \mathrm{d} x+\int_{\Omega}\left(f_{\text {hom }}\right)^{\infty}\left(\frac{\mathrm{d} D^{s} u}{\mathrm{~d}\left\|D^{s} u\right\|}(x)\right) \mathrm{d}\left\|D^{s} u\right\|(x),
$$

with

$$
f_{\text {hom }}(\xi):=\inf \left\{\int_{Y} f(y, \xi+\nabla \psi(y)) \mathrm{d} y: \psi \in W_{\#}^{1,1}(Y)\right\}, \quad\left(f_{\text {hom }}\right)^{\infty}(\xi):=\lim _{t \rightarrow \infty} \frac{f_{\text {hom }}(t \xi)}{t},
$$

and $D u=\nabla u \mathcal{L}^{N}{ }{ }_{\Omega}+D^{s} u$ is the Radon-Nikodym decomposition of $D u$ with respect to the $N$-dimensional Lebesgue measure $\mathcal{L}^{N}$.
We recall (see [26]) that $\left\{F_{\varepsilon}\right\}_{\varepsilon>0} \Gamma$-converges, as $\varepsilon \rightarrow 0^{+}$and with respect to the strong topology of $L^{1}(\Omega)$, to the functional $F_{0}$ if for all $u \in L^{1}(\Omega)$,

$$
F_{0}(u)=\Gamma-\liminf _{\varepsilon \rightarrow 0^{+}} F_{\varepsilon}(u)=\Gamma-\limsup _{\varepsilon \rightarrow 0^{+}} F_{\varepsilon}(u),
$$

where

$$
\begin{aligned}
& \Gamma-\liminf _{\varepsilon \rightarrow 0^{+}} F_{\varepsilon}(u):=\inf \left\{\liminf _{\varepsilon \rightarrow 0^{+}} F_{\varepsilon}\left(u_{\varepsilon}\right): u_{\varepsilon} \in L^{1}(\Omega), u_{\varepsilon} \rightarrow u \text { in } L^{1}(\Omega)\right\}, \\
& \Gamma-\limsup _{\varepsilon \rightarrow 0^{+}} F_{\varepsilon}(u):=\inf \left\{\limsup _{\varepsilon \rightarrow 0^{+}} F_{\varepsilon}\left(u_{\varepsilon}\right): u_{\varepsilon} \in L^{1}(\Omega), u_{\varepsilon} \rightarrow u \text { in } L^{1}(\Omega)\right\} .
\end{aligned}
$$

Moreover, under the coercivity condition in (B3), if we consider the analogous functional $I_{\varepsilon}$ of [3], i.e., the functional $I_{\varepsilon}(u):=F_{\varepsilon}(u)+\int_{\Omega}|v-u|^{p} \mathrm{~d} x$, for $u \in L^{1}(\Omega)$, where $F_{\varepsilon}$ is as in Theorem B, and $v$ and $p$ are as in Theorem A, then, assuming $\partial \Omega$ Lipschitz and using the continuous injection of $B V(\Omega)$ in $L^{p}(\Omega)$,

$$
\lim _{\varepsilon \rightarrow 0^{+}} \inf _{w \in L^{1}(\Omega)} I_{\varepsilon}(w)=\lim _{\varepsilon \rightarrow 0^{+}} \inf _{w \in W^{1,1}(\Omega)} I_{\varepsilon}(w)=\min _{w \in L^{1}(\Omega)} I_{0}(w)=\min _{w \in B V(\Omega)} I^{\mathrm{h}}(w),
$$

where $I_{0}(w):=F_{0}(w)+\int_{\Omega}|v-w|^{p} \mathrm{~d} x, I^{\mathrm{h}}(w):=F^{\mathrm{h}}(w)+\int_{\Omega}|v-w|^{p} \mathrm{~d} x$, and $F_{0}$ and $F^{\mathrm{h}}$ were introduced in Theorem B. In particular, if $f$ satisfies conditions (A1), (A2) and (A3), then $I^{\mathrm{h}}(u)=I^{\mathrm{sc}}(u, \boldsymbol{\mu})$, where $I^{\mathrm{sc}}$ and $(u, \boldsymbol{\mu}) \in B V(\Omega) \times \mathcal{M}\left(\Omega ; B V_{\#}(Y)\right)$ are as in the statement of Theorem A.
The proof of Theorem B relies on integral functionals of measures and their formulation by duality, while, as we mentioned before, the proof of Theorem A is based on the two-scale convergence method and is very similar to that of $[1$, Thm. 3.3] in which the subdifferentiability of $f$ and the regularity and boundedness of $\nabla_{\xi} f$ play a crucial role. In particular, the arguments used in [3] do not apply neither under weaker regularity hypotheses than those in (A2) nor under more general linear estimates from above and from below than those in (A3).
Some questions then naturally arise: Is it possible to derive the two-scale homogenized functional under weaker hypotheses than those considered in [3]? May we establish the relation between the two-scale
homogenized functional $I^{\text {sc }}$ and the homogenized functional $I^{\text {hom }}$ in a systematic and direct way? How to generalize this analysis to the case of multiple microscales? And to the vectorial case? The goal of this paper is precisely to give answers to these questions.
Before we state our main results we introduce some notation. Let $\varrho_{1}, \ldots, \varrho_{n}$ be positive functions on $(0, \infty)$ such that for all $i \in\{1, \cdots, n\}$ and for all $j \in\{2, \cdots, n\}$,

$$
\begin{equation*}
\lim _{\varepsilon \rightarrow 0^{+}} \varrho_{i}(\varepsilon)=0, \quad \lim _{\varepsilon \rightarrow 0^{+}} \frac{\varrho_{j}(\varepsilon)}{\varrho_{j-1}(\varepsilon)}=0 \tag{1.1}
\end{equation*}
$$

In the context of multiscale composites, the functions $\varrho_{1}, \ldots, \varrho_{n}$ stand for the length scales or scales of oscillation. The second condition in (1.1) is known as a separation of scales hypothesis. Unless stated otherwise, we will assume that the length scales $\varrho_{1}, \ldots, \varrho_{n}$ are, in addition, well separated (cf. [2]), i.e., there exists $\ell \in \mathbb{N}$ such that for all $i \in\{2, \cdots, n\}$,

$$
\begin{equation*}
\lim _{\varepsilon \rightarrow 0^{+}}\left(\frac{\varrho_{i}(\varepsilon)}{\varrho_{i-1}(\varepsilon)}\right)^{\ell} \frac{1}{\varrho_{i}(\varepsilon)}=0 \tag{1.2}
\end{equation*}
$$

A simple example of such functions is the case in which for all $i \in\{1, \cdots, n\}, \varrho_{i}=\varepsilon^{i}$.
In [35] (see also Theorem 2.3 below) we proved that from every bounded sequence $\left\{u_{\varepsilon}\right\}_{\varepsilon>0} \subset B V\left(\Omega ; \mathbb{R}^{d}\right)$ we can extract a (not relabeled) subsequence such that ${ }^{\dagger}$

$$
u_{\varepsilon} \mathcal{L}^{N}{ }_{\lfloor\Omega} \xrightarrow{(n+1)-s c} \tau_{u},
$$

where $\tau_{u} \in \mathcal{M}_{y \#}\left(\Omega \times Y_{1} \times \cdots \times Y_{n} ; \mathbb{R}^{d}\right)$ is a certain measure only depending on $u$, and

$$
D u_{\varepsilon} \xrightarrow[\varepsilon]{(n+1)-s c} \lambda_{u, \mu_{1}, \cdots, \mu_{n}},
$$

where $\lambda_{u, \mu_{1}, \cdots, \boldsymbol{\mu}_{n}} \in \mathcal{M}_{y \#}\left(\Omega \times Y_{1} \times \cdots \times Y_{n} ; \mathbb{R}^{d \times N}\right)$ is a certain measure depending on $u$ and on $n$ measures $\boldsymbol{\mu}_{i} \in \mathcal{M}_{*}\left(\Omega \times Y_{1} \times \cdots \times Y_{i-1} ; B V_{\#}\left(Y_{i} ; \mathbb{R}^{d}\right)\right)$, i.e., measures $\boldsymbol{\mu}_{i} \in \mathcal{M}\left(\Omega \times Y_{1} \times \cdots \times Y_{i-1} ; B V_{\#}\left(Y_{i} ; \mathbb{R}^{d}\right)\right)$ for which there exists a measure $\lambda_{i} \in \mathcal{M}_{y \#}\left(\Omega \times Y_{1} \times \cdots \times Y_{i} ; \mathbb{R}^{d \times N}\right)$ such that for all $B \in \mathcal{B}\left(\Omega \times Y_{1} \times \cdots Y_{i-1}\right), E \in \mathcal{B}\left(Y_{i}\right)$, we have $\left(D_{y_{i}}\left(\boldsymbol{\mu}_{i}(B)\right)\right)(E)=\lambda_{i}(B \times E)$. The measures $\tau_{u}$ and $\lambda_{u, \boldsymbol{\mu}_{1}, \cdots, \boldsymbol{\mu}_{n}}$ admit an explicit characterization, whose proof is not a simple generalization of the case $n=1$ treated in [3]. In fact, considerable modifications are required when $n \geqslant 2$, similar to those in [2] in the Sobolev setting.
In general (see [35, Prop. 3.3]), the ( $n+1$ )-scale limit captures more information on the oscillatory behavior of a bounded sequence of Radon measures than its weak- $\star$ limit in the sense of measures. This leads us to the study of the asymptotic behavior with respect to the $(n+1)$-scale convergence of first order derivatives functionals with linear growth of the form

$$
\begin{equation*}
F_{\varepsilon}(u):=\int_{\Omega} f\left(\frac{x}{\varrho_{1}(\varepsilon)}, \cdots, \frac{x}{\varrho_{n}(\varepsilon)}, \nabla u(x)\right) \mathrm{d} x+\int_{\Omega} f^{\infty}\left(\frac{x}{\varrho_{1}(\varepsilon)}, \cdots, \frac{x}{\varrho_{n}(\varepsilon)}, \frac{\mathrm{d} D^{s} u}{\mathrm{~d}\left\|D^{s} u\right\|}(x)\right) \mathrm{d}\left\|D^{s} u\right\|(x) \tag{1.3}
\end{equation*}
$$

for $u \in B V\left(\Omega ; \mathbb{R}^{d}\right)$, where

$$
f^{\infty}\left(y_{1}, \cdots, y_{n}, \xi\right):=\limsup _{t \rightarrow \infty} \frac{f\left(y_{1}, \cdots, y_{n}, t \xi\right)}{t}
$$

is the recession function of a real valued function $f: \mathbb{R}^{n N} \times \mathbb{R}^{d \times N} \rightarrow \mathbb{R}$, separately periodic in the first $n$ variables. Precisely, we seek to characterize and relate the functionals

$$
\begin{equation*}
F^{\mathrm{sc}}\left(u, \boldsymbol{\mu}_{1}, \cdots, \boldsymbol{\mu}_{n}\right):=\inf \left\{\liminf _{\varepsilon \rightarrow 0^{+}} F_{\varepsilon}\left(u_{\varepsilon}\right): u_{\varepsilon} \in B V\left(\Omega ; \mathbb{R}^{d}\right), D u_{\varepsilon} \frac{(n+1)-s c}{\varepsilon} \lambda_{u, \mu_{1}, \ldots, \boldsymbol{\mu}_{n}}\right\} \tag{1.4}
\end{equation*}
$$

[^1]and
\[

$$
\begin{equation*}
F^{\mathrm{hom}}(u):=\inf \left\{\liminf _{\varepsilon \rightarrow 0^{+}} F_{\varepsilon}\left(u_{\varepsilon}\right): u_{\varepsilon} \in B V\left(\Omega ; \mathbb{R}^{d}\right), u_{\varepsilon} \stackrel{\star}{\varepsilon}_{\varepsilon} u \text { weakly-丸 in } B V\left(\Omega ; \mathbb{R}^{d}\right)\right\} \tag{1.5}
\end{equation*}
$$

\]

for $u \in B V\left(\Omega ; \mathbb{R}^{d}\right)$ and $\mu_{i} \in \mathcal{M}_{\star}\left(\Omega \times Y_{1} \times \cdots \times Y_{i-1} ; B V_{\#}\left(Y_{i} ; \mathbb{R}^{d}\right)\right), i \in\{1, \cdots, n\}$, where $F_{\varepsilon}$ is given by (1.3).

Consider the following conditions:
$(\mathcal{F} 1)$ for all $\xi \in \mathbb{R}^{d \times N}, f(\cdot, \xi)$ is $Y_{1} \times \cdots \times Y_{n}$-periodic;
$(\mathcal{F} 2)$ for all $y_{1}, \ldots, y_{n} \in \mathbb{R}^{N}, f\left(y_{1}, \cdots, y_{n}, \cdot\right)$ is convex;
$(\mathcal{F} 3)$ there exists $C>0$ such that for all $y_{1}, \ldots, y_{n} \in \mathbb{R}^{N}, \xi \in \mathbb{R}^{d \times N}$,

$$
f\left(y_{1}, \cdots, y_{n}, \xi\right) \leqslant C(1+|\xi|)
$$

$(\mathcal{F} 4)$ for all $\delta>0$ there exist $c_{\delta} \in \mathbb{R}^{N}, b_{\delta} \in \mathbb{R}$, such that $\left|c_{\delta}\right| \rightarrow 0$ as $\delta \rightarrow 0^{+}$, and for all $y_{1}, \ldots, y_{n} \in \mathbb{R}^{N}$, $\xi \in \mathbb{R}^{d \times N}$,

$$
f\left(y_{1}, \cdots, y_{n}, \xi\right)+c_{\delta} \cdot \xi+b_{\delta} \geqslant 0
$$

$(\mathcal{F} 4)^{\prime}$ there exists $C>0$ such that for all $y_{1}, \ldots, y_{n} \in \mathbb{R}^{N}, \xi \in \mathbb{R}^{d \times N}$,

$$
f\left(y_{1}, \cdots, y_{n}, \xi\right) \geqslant \frac{1}{C}|\xi|-C
$$

$(\mathcal{F} 5)$ for every $y_{1}^{\prime}, \ldots, y_{n}^{\prime} \in \mathbb{R}^{N}, \delta>0$, there exists $\tau=\tau\left(y_{1}^{\prime}, \cdots, y_{n}^{\prime}, \delta\right)$ such that for all $y_{1}, \ldots, y_{n} \in \mathbb{R}^{N}$ with $\left|\left(y_{1}^{\prime}, \cdots, y_{n}^{\prime}\right)-\left(y_{1}, \cdots, y_{n}\right)\right| \leqslant \tau$, and for all $\xi \in \mathbb{R}^{d \times N}$,

$$
\left|f\left(y_{1}^{\prime}, \cdots, y_{n}^{\prime}, \xi\right)-f\left(y_{1}, \cdots, y_{n}, \xi\right)\right| \leqslant \delta(1+|\xi|)
$$

$(\mathcal{F} 6)$ for all $\delta>0$ there exists $\tilde{a}_{\delta} \in L_{\#}^{1}\left(Y_{1} \times \cdots \times Y_{n}\right)$ such that $\delta\left\|\tilde{d}_{\delta}\right\|_{L_{\#}^{1}\left(Y_{1} \times \cdots \times Y_{n}\right)} \rightarrow 0$ as $\delta \rightarrow 0^{+}$, and there exits $\tau_{\delta}>0$ such that for all $y_{1}, \ldots, y_{n-1}, y_{1}^{\prime}, \ldots, y_{n-1}^{\prime} \in \mathbb{R}^{N}$ with $\left|\left(y_{1}, \cdots, y_{n-1}\right)-\left(y_{1}^{\prime}, \cdots, y_{n-1}^{\prime}\right)\right| \leqslant \tau_{\delta}$, and for all $y_{n}, \xi \in \mathbb{R}^{d \times N}$,

$$
f\left(y_{1}, \cdots, y_{n-1}, y_{n}, \xi\right) \geqslant \delta \tilde{a}_{\delta}\left(y_{1}^{\prime}, \cdots, y_{n-1}^{\prime}, y_{n}\right)+(1+o(1)) f\left(y_{1}^{\prime}, \cdots, y_{n-1}^{\prime}, y_{n}, \xi\right)
$$

(as $\delta \rightarrow 0^{+}$). If $n \geqslant 3$, then we assume in addition that for a.e. $y_{n-1}, y_{n} \in \mathbb{R}^{N}$ we have $\tilde{a}_{\delta}\left(\cdot, y_{n-1}, y_{n}\right) \in C_{\#}\left(Y_{1} \times \cdots \times Y_{n-2}\right)$ with $\left\|\tilde{a}_{\delta}\left(\cdot, y_{n-1}, y_{n}\right)\right\|_{C_{\#}\left(Y_{1} \times \cdots \times Y_{n-2}\right)} \in L^{1}\left(Y_{n-1} \times Y_{n}\right)$;
$(\mathcal{F} 7)$ there exist $\alpha \in(0,1)$ and $L, C>0$, such that for all $y_{1}, \ldots, y_{n} \in \mathbb{R}^{N}$, for all $\xi \in \mathbb{R}^{d \times N}$ with $|\xi|=1$, and for all $t \geqslant L$,

$$
\left|f^{\infty}\left(y_{1}, \cdots, y_{n}, \xi\right)-\frac{f\left(y_{1}, \cdots, y_{n}, t \xi\right)}{t}\right| \leqslant \frac{C}{t^{\alpha}}
$$

$(\mathcal{F} 8)$ the conjugate function $f^{*}$ of $f$ is a bounded function on its effective domain, $\operatorname{dom}_{e} f^{*}$.
Our main result is the following.
Theorem 1.1. Let $\Omega \subset \mathbb{R}^{N}$ be an open, bounded set with $\partial \Omega$ Lipschitz, let $Y_{i}:=(0,1)^{N}, i \in\{1, \cdots, n\}$, and let $f: \mathbb{R}^{n N} \times \mathbb{R}^{d \times N} \rightarrow \mathbb{R}$ be a Borel function satisfying $(\mathcal{F} 1)-(\mathcal{F} 4)$, $(\mathcal{F} 5)$ and $(\mathcal{F} 6)$. Then, for all $\left(u, \boldsymbol{\mu}_{1}, \cdots, \boldsymbol{\mu}_{n}\right) \in B V\left(\Omega ; \mathbb{R}^{d}\right) \times \mathcal{M}_{\star}\left(\Omega ; B V_{\#}\left(Y_{1} ; \mathbb{R}^{d}\right)\right) \times \cdots \times \mathcal{M}_{\star}\left(\Omega \times Y_{1} \times \cdots \times Y_{n-1} ; B V_{\#}\left(Y_{n} ; \mathbb{R}^{d}\right)\right)$,

$$
\begin{align*}
& F^{\mathrm{sc}}\left(u, \boldsymbol{\mu}_{1}, \cdots, \boldsymbol{\mu}_{n}\right)=\int_{\Omega \times Y_{1} \times \cdots \times Y_{n}} f\left(y_{1}, \cdots, y_{n}, \frac{\left.\mathrm{~d} \lambda_{u \boldsymbol{\mu}_{1}, \ldots, \boldsymbol{\mu}_{n}}^{a c}\left(x, y_{1}, \cdots, y_{n}\right)\right) \mathrm{d} x \mathrm{~d} y_{1} \cdots \mathrm{~d} y_{n}}{\mathrm{~d}(n+1) N}\right. \\
& \quad+\int_{\Omega \times Y_{1} \times \cdots \times Y_{n}} f^{\infty}\left(y_{1}, \cdots, y_{n}, \frac{\left.\mathrm{~d} \lambda_{u, \boldsymbol{\mu}_{1}, \ldots, \boldsymbol{\mu}_{n}}^{\mathrm{d}\left\|\lambda_{u, \boldsymbol{\mu}_{1}, \ldots, \boldsymbol{\mu}_{n}}^{s}\right\|}\left(x, y_{1}, \cdots, y_{n}\right)\right) \mathrm{d}\left\|\lambda_{u, \boldsymbol{\mu}_{1}, \ldots, \boldsymbol{\mu}_{n}}^{s}\right\|\left(x, y_{1}, \cdots, y_{n}\right) .}{} .\right. \tag{1.6}
\end{align*}
$$

Moreover, for all $u \in B V\left(\Omega ; \mathbb{R}^{d}\right), \dagger$

$$
\begin{align*}
F^{\mathrm{hom}}(u)= & \inf _{\substack{\mu_{1} \in \mathcal{M}_{\star}\left(\Omega ; ; V_{\#}\left(Y_{1} ; \mathbb{R}^{d}\right)\right), \ldots, \mu_{n} \in \mathcal{M}_{\star}\left(\Omega \times Y_{1} \times \cdots \times Y_{n-1} ; B V \#\left(Y_{n} ; \mathbb{R}^{d}\right)\right)}} F^{\mathrm{sc}}\left(u, \boldsymbol{\mu}_{1}, \cdots, \boldsymbol{\mu}_{n}\right) \\
= & \int_{\Omega} f_{\mathrm{hom}}(\nabla u(x)) \mathrm{d} x+\int_{\Omega}\left(f_{0^{+}, \text {hom }}\right)^{\infty}\left(\frac{\mathrm{d} D^{s} u}{\mathrm{~d}\left\|D^{s} u\right\|}(x)\right) \mathrm{d}\left\|D^{s} u\right\|(x), \tag{1.7}
\end{align*}
$$

where for all $\xi \in \mathbb{R}^{d \times N}$,

$$
\left(f_{0^{+}, \text {hom }}\right)^{\infty}(\xi):=\lim _{\eta \rightarrow 0^{+}}\left(\left(f_{\eta}\right)_{\mathrm{hom}}\right)^{\infty}(\xi)
$$

with $f_{\eta}$, the function defined for $\eta>0, y_{1}, \ldots, y_{n} \in \mathbb{R}^{N}$, and $\xi \in \mathbb{R}^{d \times N}$, by

$$
\begin{equation*}
f_{\eta}\left(y_{1}, \cdots, y_{n}, \xi\right):=f\left(y_{1}, \cdots, y_{n}, \xi\right)+\eta|\xi| \tag{1.8}
\end{equation*}
$$

Furthermore, if in addition
(i) $f$ satisfies one of the two conditions $(\mathcal{F} 4)^{\prime}$ or $(\mathcal{F} 8)$, then $\left(f_{0^{+}, \text {hom }}\right)^{\infty} \equiv\left(f_{\text {hom }}\right)^{\infty}$;
(ii) $f$ satisfies $(\mathcal{F} 7)$, then $\left(f_{0^{+}, \text {hom }}\right)^{\infty} \equiv\left(f^{\infty}\right)_{\text {hom }}$.

We remark that in Theorem 1.1 we do not assume coercivity nor boundedness from below of $f$. The main ingredients of the proof are the unfolding operator (see [20], [22]; see also [36]) and Reshetnyak's continuityand lower semicontinuity-type results. The approach via the unfolding operator, in connection with the notion of two-scale convergence and in the framework of homogenization problems, sometimes referred as periodic unfolding method, has already been adopted by other authors in the Sobolev setting (see, for example, [20], [21], [36]).

We use the convexity hypothesis $(\mathcal{F} 2)$ when establishing the lower bound for the infimum defining $F^{\text {sc }}$, which is based on a sequential lower semicontinuity argument. We start by proving that the $(n+1)$-scale convergence of a sequence of measures absolutely continuous with respect to the Lebesgue measure is equivalent to the weak- $\star$ convergence on the product space $\Omega \times Y_{1} \times \cdots \times Y_{n}$ in the sense of measures of the unfolded sequence, i.e., the image through the unfolding operator of the original sequence (see Lemma 3.4). Then we prove that the energy $F_{\varepsilon}$ does not increase by means of the unfolding operator (see Lemma 3.2). In order to conclude we need sequential lower semicontinuity of the functional

$$
\begin{aligned}
F(\lambda):= & \int_{\Omega \times Y_{1} \times \cdots \times Y_{n}} f\left(y_{1}, \cdots, y_{n}, \frac{\mathrm{~d} \lambda^{a c}}{\mathrm{~d} \mathcal{L}^{(n+1) N}}\left(x, y_{1}, \ldots, y_{n}\right)\right) \mathrm{d} x \mathrm{~d} y_{1} \cdots \mathrm{~d} y_{n} \\
& +\int_{\Omega \times Y_{1} \times \cdots \times Y_{n}} f^{\infty}\left(y_{1}, \cdots, y_{n}, \frac{\mathrm{~d} \lambda^{s}}{\mathrm{~d}\left\|\lambda^{s}\right\|}\left(x, y_{1}, \ldots, y_{n}\right)\right) \mathrm{d}\left\|\lambda^{s}\right\|\left(x, y_{1}, \ldots, y_{n}\right)
\end{aligned}
$$

for $\lambda \in \mathcal{M}_{y \#}\left(\Omega \times Y_{1} \times \cdots \times Y_{n} ; \mathbb{R}^{d \times N}\right)$, with respect to weak-丸 convergence in the sense of measures, which requires convexity of $f$ in the last variable (see, for example, [4]). In the scalar case $d=1$ we can overcome this difficulty by a relaxation argument with respect to the weak topology of $W^{1,1}(\Omega)$, which cannot be applied in the vectorial case since quasiconvexity is a weaker condition than convexity (see, for example, [24]). As a corollary of Theorem 1.1, we obtain the following result concerning the scalar case $d=1$.

Corollary 1.2. Let $\Omega \subset \mathbb{R}^{N}$ be an open and bounded set with $\partial \Omega$ Lipschitz, let $Y_{i}:=(0,1)^{N}, i \in\{1, \cdots, n\}$, let $f: \mathbb{R}^{n N} \times \mathbb{R}^{N} \rightarrow \mathbb{R}$ be a Borel function satisfying conditions $(\mathcal{F} 1),(\mathcal{F} 3),(\mathcal{F} 4),(\mathcal{F} 5)$ and ( $\left.\mathcal{F} 6\right)$ with $d=1$ and with $o(1)$ replaced by $-|o(1)|$ in $(\mathcal{F} 6)$, and let $f_{\eta}$ be given by (1.8). Then, for all $\left(u, \mu_{1}, \cdots, \boldsymbol{\mu}_{n}\right) \in B V(\Omega) \times \mathcal{M}_{\star}\left(\Omega ; B V_{\#}\left(Y_{1}\right)\right) \times \cdots \times \mathcal{M}_{\star}\left(\Omega \times Y_{1} \times \cdots Y_{n-1} ; B V_{\#}\left(Y_{n}\right)\right), \dagger \dagger$

$$
\begin{align*}
& F^{\mathrm{sc}}\left(u, \boldsymbol{\mu}_{1}, \cdots, \boldsymbol{\mu}_{n}\right)=\int_{\Omega \times Y_{1} \times \cdots \times Y_{n}} f^{* *}\left(y_{1}, \cdots, y_{n}, \frac{\left.\mathrm{~d} \lambda_{u, \boldsymbol{\mu}_{1}, \ldots, \boldsymbol{\mu}_{n}}^{a c}\left(x, y_{1}, \cdots, y_{n}\right)\right) \mathrm{d} x \mathrm{~d} y_{1} \cdots \mathrm{~d} y_{n}}{\mathrm{~d}(n+1) N}\right. \\
& \quad+\int_{\Omega \times Y_{1} \times \cdots \times Y_{2}}\left(\left(f_{0^{+}}\right)^{* *}\right)^{\infty}\left(y_{1}, \cdots, y_{n}, \frac{\mathrm{~d} \lambda_{u, \boldsymbol{\mu}_{1}, \ldots, \boldsymbol{\mu}_{n}}^{s}}{\mathrm{~d}\left\|\lambda_{u, \boldsymbol{\mu}_{1}, \ldots, \boldsymbol{\mu}_{n}}^{s}\right\|}\left(x, y_{1}, \cdots, y_{n}\right)\right) \mathrm{d}\left\|\lambda_{u, \boldsymbol{\mu}_{1}, \ldots, \boldsymbol{\mu}_{n}}^{s}\right\|\left(x, y_{1}, \cdots, y_{n}\right) \tag{1.9}
\end{align*}
$$

[^2]where
for all $y_{1}, \ldots, y_{n} \in \mathbb{R}^{N}, \xi \in \mathbb{R}^{N}$,
$$
\left(\left(f_{0^{+}}\right)^{* *}\right)^{\infty}\left(y_{1}, \ldots, y_{n}, \xi\right):=\lim _{\eta \rightarrow 0^{+}}\left(\left(f_{\eta}\right)^{* *}\right)^{\infty}\left(y_{1}, \ldots, y_{n}, \xi\right)
$$

Moreover, for all $u \in B V(\Omega)$,

$$
\begin{align*}
F^{\mathrm{hom}}(u) & =\inf _{\substack{\mu_{1} \in \mathcal{M}_{\star}\left(\Omega ; B V_{\#+( }\left(Y_{1}\right)\right), \ldots, \mu_{n} \in \mathcal{M}_{\star}\left(\Omega \times Y_{1} \times \ldots \times Y_{n-1} ; B V_{\#}\left(Y_{n}\right)\right)}} F^{\mathrm{sc}}\left(u, \boldsymbol{\mu}_{1}, \cdots, \boldsymbol{\mu}_{n}\right) \\
& =\int_{\Omega}\left(f^{* *}\right)_{\text {hom }}(\nabla u(x)) \mathrm{d} x+\int_{\Omega}\left(\left(\left(f_{0^{+}}\right)^{* *}\right)_{\text {hom }}\right)^{\infty}\left(\frac{\mathrm{d} D^{s} u}{\mathrm{~d}\left\|D^{s} u\right\|}(x)\right) \mathrm{d}\left\|D^{s} u\right\|(x), \tag{1.10}
\end{align*}
$$

where for all $\xi \in \mathbb{R}^{N}$,

$$
\left(\left(\left(f_{0^{+}}\right)^{* *}\right)_{\text {hom }}\right)^{\infty}(\xi):=\lim _{\eta \rightarrow 0^{+}}\left(\left(\left(f_{\eta}\right)^{* *}\right)_{\text {hom }}\right)^{\infty}(\xi)
$$

Furthermore, if in addition
(i) $f$ satisfies the coercivity condition $(\mathcal{F} 4)^{\prime}$, then $\left(\left(f_{0^{+}}\right)^{* *}\right)^{\infty} \equiv\left(f^{* *}\right)^{\infty}$ and $\left(\left(\left(f_{0^{+}}\right)^{* *}\right)_{\text {hom }}\right)^{\infty} \equiv$ $\left(\left(f^{* *}\right)_{\text {hom }}\right)^{\infty}$;
(ii) $f$ satisfies $(\mathcal{F} 7)$, then $\left(\left(f_{0^{+}}\right)^{* *}\right)^{\infty} \equiv\left(f^{\infty}\right)^{* *}$ and $\left(\left(\left(f_{0^{+}}\right)^{* *}\right)_{\text {hom }}\right)^{\infty} \equiv\left(\left(f^{\infty}\right)^{* *}\right)_{\text {hom }}$.

Remark 1.3. (Comments on the hypotheses) (i) If $f$ is bounded from below, then ( $\mathcal{F} 4)$ is satisfied: it suffices to take $c_{\delta} \equiv 0$ and $b_{\delta} \equiv-b$, where $b:=\inf f \in \mathbb{R}$. Hypothesis $(\mathcal{F} 4)$ may be regarded as a stronger version of the condition
$(\mathcal{F} 4)^{\star}$ for all $\delta>0$ there exists $b_{\delta} \in \mathbb{R}$ such that for all $y_{1}, \ldots, y_{n}, \xi \in \mathbb{R}^{N}$,

$$
f\left(y_{1}, \cdots, y_{n}, \xi\right)+\delta|\xi|+b_{\delta} \geqslant 0
$$

so $f$ cannot decrease as $-|\xi|$ but it can decrease as $-|\xi|^{\alpha}$ with $\alpha \in(0,1):$ If $\tilde{f}: \mathbb{R}^{n N} \times \mathbb{R}^{d \times N} \rightarrow[0, \infty)$ is a nonnegative function, and $b \in \mathbb{R}, c>0$, then for all $\alpha \in(0,1)$,

$$
f\left(y_{1}, \cdots, y_{n}, \xi\right):=\tilde{f}\left(y_{1}, \cdots, y_{n}, \xi\right)-c|\xi|^{\alpha}+b
$$

is a function satisfying $(\mathcal{F} 4)^{\star}$. We do not assume $(\mathcal{F} 4)^{\star}$ in place of $(\mathcal{F} 4)$ in Theorem 1.1 and Corollary 1.2 because in general the former is not inherited neither by $f_{\text {hom }}$ nor by $f^{* *}$ from $f$, whereas the latter is.

We observe that if $f$ is lower semicontinuous and independent of $\left(y_{1}, \cdots, y_{n}\right)$, then $f$ satisfies $(\mathcal{F} 4)^{\star}$ if, and only if, it satisfies

$$
\begin{equation*}
\liminf _{|\xi| \rightarrow \infty} \frac{f(\xi)}{|\xi|} \geqslant 0 \tag{1.11}
\end{equation*}
$$

Moreover, if $f$ is in addition convex, then (1.11) is a necessary and sufficient condition for the sequentially lower semicontinuity with respect to weak-ネ convergence in the sense of measures of the functional

$$
u \in L^{1}\left(\Omega ; \mathbb{R}^{d \times N}\right) \mapsto \int_{\Omega} f(u(x)) \mathrm{d} x
$$

Furthermore, (1.11) yields

$$
\liminf _{\varepsilon \rightarrow 0^{+}} \int_{\Omega} f\left(u_{\varepsilon}(x)\right) \mathrm{d} x \geqslant \int_{\Omega} f\left(\frac{\mathrm{~d} \lambda^{a c}}{\mathrm{~d} \mathcal{L}^{N}}(x)\right) \mathrm{d} x+\int_{\Omega} f^{\infty}\left(\frac{\mathrm{d} \lambda^{s}}{\mathrm{~d}\left\|\lambda^{s}\right\|}(x)\right) \mathrm{d}\left\|\lambda^{s}\right\|(x)
$$

whenever $u_{\varepsilon} \mathcal{L}^{N}{ }_{[\Omega} \stackrel{\star}{ } \lambda$ weakly- $\star$ in $\mathcal{M}\left(\Omega ; \mathbb{R}^{d \times N}\right)$ (see [37, Thm. 5.21]). This fact will be used when establishing (1.7) and (1.10).

An example of a function satisfying $(\mathcal{F} 4)$ but not $(\mathcal{F} 4)^{\prime}$ is the following. Assume that $N=d=1$, let $h: \mathbb{R}^{n} \rightarrow \mathbb{R}$ be a continuous and $Y_{1} \times \cdots \times Y_{n}$-periodic function, and let $g: \mathbb{R} \rightarrow \mathbb{R}$ be the function given by

$$
g(\xi):= \begin{cases}\frac{\xi-1}{2} & \text { if } \xi \geqslant-1 \\ \sqrt{-\xi} & \text { if } \xi<-1\end{cases}
$$

Then $f: \mathbb{R}^{n} \times \mathbb{R} \rightarrow \mathbb{R}$ defined by $f\left(y_{1}, \cdots, y_{n}, \xi\right):=h\left(y_{1}, \cdots, y_{n}\right) g(\xi)$ satisfies $(\mathcal{F} 4)$ but not $(\mathcal{F} 4)$ '. We observe also that $f$ satisfies, in addition, $(\mathcal{F} 1),(\mathcal{F} 5)$ and $(\mathcal{F} 6)$ with $d=1$ and with $o(1)$ replaced by $-|o(1)|$ in $(\mathcal{F} 6)$, so that Corollary applies to $f$.
(ii) If $f$ satisfies a growth condition of the form $\left|f\left(y_{1}, \cdots, y_{n}, \underline{\xi}\right)\right| \leqslant C(1+|\xi|)$ and is convex in the last variable, then (see [12]) ( $\mathcal{F} 5$ ) holds if, and only if, the function $\bar{f}: \mathbb{R}^{n N} \times \mathbb{R}^{d \times N} \times[0, \infty) \rightarrow \mathbb{R}$ defined by

$$
\bar{f}\left(y_{1}, \cdots, y_{n}, \xi, t\right):= \begin{cases}t f\left(y_{1}, \cdots, y_{n}, \frac{\xi}{t}\right) & \text { if } t>0 \\ f^{\infty}\left(y_{1}, \cdots, y_{n}, \xi\right) & \text { if } t=0\end{cases}
$$

is continuous. In particular, if $f$ is continuous, positively 1-homogeneous in the last variable, and satisfies $(\mathcal{F} 2),(\mathcal{F} 3)$, and $(\mathcal{F} 4)^{\star}$, then it also satisfies $(\mathcal{F} 5)$ since in this setting $\bar{f}$ is continuous.
The continuity of $\bar{f}$ will be crucial in our analysis in order to apply Reshetnyak's continuity- and lower semicontinuity-type results (see Lemmas 3.5 and 3.6 below).
(iii) Hypothesis $(\mathcal{F} 6)$ is a weaker version of the hypothesis
$(\mathcal{F} 6)^{\prime}$ there exist a continuous, positive function $\omega$ satisfying $\omega(0)=0$, and a function $a \in L_{\#}^{1}\left(Y_{n}\right)$ such that for all $y_{1}, \ldots, y_{n-1}, y_{1}^{\prime}, \ldots, y_{n-1}^{\prime}, y_{n}, \xi \in \mathbb{R}^{d \times N}$, we

$$
\begin{aligned}
& \left|f\left(y_{1}, \cdots, y_{n-1}, y_{n}, \xi\right)-f\left(y_{1}^{\prime}, \cdots, y_{n-1}^{\prime}, y_{n}, \xi\right)\right| \\
\leqslant & \omega\left(\left|\left(y_{1}, \cdots, y_{n-1}\right)-\left(y_{1}^{\prime} \cdots, y_{n-1}^{\prime}\right)\right|\right)\left(a\left(y_{n}\right)+f\left(y_{1}, \cdots, y_{n}, \xi\right)\right)
\end{aligned}
$$

which often appears in the literature (see, for example, [17], [48]).
If $f$ is of the form $f\left(y_{1}, \cdots, y_{n}, \xi\right):=g\left(y_{1}, \cdots, y_{n-1}\right) h\left(y_{n}, \xi\right)$, where $g$ is a continuous and $Y_{1} \times \cdots \times Y_{n-1}$ periodic function, and $h$ is a function satisfying $(\mathcal{F} 1)-(\mathcal{F} 5)$, then $f$ satisfies $(\mathcal{F} 1)-(\mathcal{F} 6)$; in particular, we may consider $g \equiv 1$, which corresponds to the case of one microscale (i.e., $n=1$ ) and so, in this situation, $(\mathcal{F} 6)$ is trivially satisfied. Other simple examples of functions satisfying $(\mathcal{F} 1)-(\mathcal{F} 6)$ are functions of the form $f\left(y_{1}, \cdots, y_{n}, \xi\right):=g\left(y_{1}, \cdots, y_{n}\right) h(\xi)$, where $g$ is continuous and $Y_{1} \times \cdots \times Y_{n}$-periodic, and $h$ satisfies $(\mathcal{F} 2)-(\mathcal{F} 4)$.
(iv) Hypothesis ( $\mathcal{F} 7$ ) is common within variational problems with linear growth conditions (see, for example, [15, Sect. 4], [9]). We will prove (see Lemma 2.8 below) that under hypotheses ( $\mathcal{F} 1$ ), $(\mathcal{F} 3),(\mathcal{F} 4)^{\prime}$ and ( $\left.\mathcal{F} 7\right)$, we have $\left(f_{\text {hom }}\right)^{\infty}=\left(f^{\infty}\right)_{\text {hom }}$; in the scalar case, these conditions also ensure the equality $\left(f^{* *}\right)^{\infty}=\left(f^{\infty}\right)^{* *}$. Other sufficient conditions to guarantee that $\left(f_{\text {hom }}\right)^{\infty}=\left(f^{\infty}\right)_{\text {hom }}$ are $(\mathcal{F} 1)-(\mathcal{F} 4)$ and ( $\left.\mathcal{F} 8\right)$ (see Lemma 2.7 below), which is an hypothesis on $f^{*}$ that is often considered when dealing with duality problems (see, for example, [51, Ch. II.4]).

Remark 1.4. (i) Equalities (1.6) and the first one in (1.7) are valid under the more general growth condition from below $(\mathcal{F} 4)^{\star}$ (introduced in Remark 1.3 (i)). The reason why this condition is not enough in order to conclude the second equality in (1.7) is that in general it is not inherited by $f_{\text {hom }}$, while $(\mathcal{F} 4)$ is and this ensures that $f_{\text {hom }}$ satisfies (1.11), which, as we will see, will play a crucial role in the proof.
(ii) In Theorem 1.1 and Corollary 1.2, we need the length scales to satisfy condition (1.2) only to establish the equalities (1.7) and (1.10) involving $F^{\text {hom }}$.

In the case in which $n=1$ and $d=1$, we recover Amar's integral representation [3] of the two-scale homogenized functional $F^{\text {sc }}$ under more general conditions (see Remark 1.3 (ii) and (iii)). Furthermore, if we assume a priori compactness of a diagonal infimizing sequence for the sequence of functionals $\left\{F_{\varepsilon}\right\}_{\varepsilon>0}$,
we recover Amar's result [3] under more general conditions. We observe that even if a priori compactness of a diagonal infimizing sequence is assumed in Theorem A, the coercivity condition is still needed to validate the arguments in [3]. We also recover Bouchitté's integral representation [13] of the effective energy $F^{\text {hom }}$ without assuming coercivity of $f$ and without assuming convexity of $f$ in the second variable, but assuming continuity in the first one in order to apply Reshetnyak Continuity Theorem, while in [13] $f$ is assumed to be convex in the second variable and coercive, but only measurable and $Y$-periodic in the first variable.

If $n=1$ and $d>1$ in Theorem 1.1, then we recover De Arcangelis and Gargiulo's integral representation [31] of the effective energy $F^{\text {hom }}$ without assuming $f$ to be bounded from below, but assuming $f$ to be continuous in the first variable and convex in the second one, while in [31] $f$ is only required to be nonnegative, measurable and $Y$-periodic in the first variable and continuous in the second one. As we mentioned before, our hypotheses are related to the periodic unfolding method and Reshetnyak Continuity Theorem's hypotheses.

In the case in which $n \geqslant 2$, Theorem 1.1 and Corollary 1.2 provide new results in the literature in that, to the best of our knowledge, the homogenization of nonlinear periodically oscillating functionals with linear growth and characterized by $n \geqslant 2$ microscales has not yet been carried out.
Finally, in the framework of homogenization by $\Gamma$-convergence in the $B V$ setting and for $n=1$ we also mention the works by Braides and Chiatò Piat [16] and Carbone, Cioranescu, De Arcangelis and Gaudiello [18] concerning the convex case; and Bouchitté, Fonseca and Mascarenhas [15, Sect. 4.3], Attouch, Buttazzo and Michaille [7, Sect. 12.3] and Babadjian and Millot [8] regarding the nonconvex case.

This paper is organized as follows. In Section 2, we collect the necessary notation and we recall some basic properties of $\left(\mathbb{R}^{m}\right.$-valued) Radon measures and of functions of bounded variation. We also recall some results established in [35] and we prove some auxiliary propositions that will be used in the subsequent sections. In Section 3 we prove Theorem 1.1, and in Section 4 we prove Corollary 1.2.

## 2. Notation and preliminaries

### 2.1. Notation

In the sequel $Z$ is a $\sigma$-compact separable metric space, $\Omega$ is an open subset of $\mathbb{R}^{N}, N \in \mathbb{N}$, and $Y:=(0,1)^{N}$ is the reference cell. For each $i \in \mathbb{N}, Y_{i}$ stands for a copy of $Y$. Given $x \in \mathbb{R}^{N}$, we write $[x]$ and $\langle x\rangle$ to denote the integer and the fractional part of $x$ componentwise, respectively, so that $x=[x]+\langle x\rangle$ and $[x] \in \mathbb{Z}^{N}$, $\langle x\rangle \in Y$.
Let $n, m \in \mathbb{N}$. If $x, y \in \mathbb{R}^{m}$, then $x \cdot y$ stands for the Euclidean inner product of $x$ and $y$, and $|x|:=\sqrt{x \cdot x}$ for the Euclidean norm of $x$. The space of $(m \times n)$-dimensional matrices will be identified with $\mathbb{R}^{m n}$, and we write $\mathbb{R}^{m \times n}$. If $\xi=\left(\xi_{i j}\right)_{1 \leqslant i \leqslant m, 1 \leqslant j \leqslant n}, \zeta=\left(\zeta_{i j}\right)_{1 \leqslant i \leqslant m, 1 \leqslant j \leqslant n} \in \mathbb{R}^{m \times n}$, then

$$
\xi: \zeta:=\sum_{i=1}^{m} \sum_{j=1}^{n} \xi_{i j} \zeta_{i j}
$$

represents the inner product of $\xi$ and $\zeta$, while $|\xi|:=\sqrt{\xi: \xi}$ denotes the norm of $\xi$. If $a \in \mathbb{R}^{m}$ and $b \in \mathbb{R}^{n}$, then $a \otimes b$ stands for the $(m \times n)$-dimensional rank-one matrix defined by $a \otimes b:=\left(a_{i} b_{j}\right)_{1 \leqslant i \leqslant m, 1 \leqslant j \leqslant n}$.
Let $g: \mathbb{R}^{n N} \rightarrow \mathbb{R}^{m}$ be a function. We denote the Lipschitz constant of $g$ on a set $D \subset \mathbb{R}^{n N}$ by $\operatorname{Lip}(g ; D)$; if $D$ coincides with the domain of $g$ we omit its dependence. We say that $g$ is $Y_{1} \times \cdots \times Y_{n}$-periodic if for all $i \in\{1, \cdots, n\}, \kappa \in \mathbb{Z}^{N}, y_{1}, \ldots, y_{n} \in \mathbb{R}^{N}$, one has $g\left(y_{1}, \cdots, y_{i}+\kappa, \cdots, y_{n}\right)=g\left(y_{1}, \cdots, y_{i}, \cdots, y_{n}\right)$.
We will consider the Banach spaces

$$
C_{\#}\left(Y_{1} \times \cdots \times Y_{n} ; \mathbb{R}^{m}\right):=\left\{g \in C\left(\mathbb{R}^{n N} ; \mathbb{R}^{m}\right): g \text { is } Y_{1} \times \cdots \times Y_{n} \text {-periodic }\right\}
$$

endowed with the supremum norm $\|\cdot\|_{\infty}$, and $C_{0}\left(Z ; C_{\#}\left(Y_{1} \times \cdots \times Y_{n} ; \mathbb{R}^{m}\right)\right)$, which is the closure with respect to the supremum norm $\|\cdot\|_{\infty}$ of $C_{c}\left(Z ; C_{\#}\left(Y_{1} \times \cdots \times Y_{n} ; \mathbb{R}^{m}\right)\right)$. The latter is the space of all functions $g: Z \times \mathbb{R}^{n N} \rightarrow \mathbb{R}^{m}$ such that for all $z \in Z, g(z, \cdot) \in C_{\#}\left(Y_{1} \times \cdots \times Y_{n} ; \mathbb{R}^{m}\right)$ and for all $y_{1}, \ldots, y_{n} \in \mathbb{R}^{N}$,
$g\left(\cdot, y_{1}, \ldots, y_{n}\right) \in C_{c}\left(Z ; \mathbb{R}^{m}\right)$. The spaces $C_{\#}^{k}\left(Y_{1} \times \cdots \times Y_{n} ; \mathbb{R}^{m}\right), C_{\#}^{\infty}\left(Y_{1} \times \cdots \times Y_{n} ; \mathbb{R}^{m}\right), C_{c}^{k}\left(Z ; C_{\#}^{k}\left(Y_{1} \times \cdots \times\right.\right.$ $\left.\left.Y_{n} ; \mathbb{R}^{m}\right)\right), C_{c}^{\infty}\left(Z ; C_{\#}^{\infty}\left(Y_{1} \times \cdots \times Y_{n} ; \mathbb{R}^{m}\right)\right), C_{0}^{k}\left(Z ; C_{\#}^{k}\left(Y_{1} \times \cdots \times Y_{n} ; \mathbb{R}^{m}\right)\right)$ and $C_{0}^{\infty}\left(Z ; C_{\#}^{\infty}\left(Y_{1} \times \cdots \times Y_{n} ; \mathbb{R}^{m}\right)\right)$ are now defined in an obvious way.

If $m=1$ the co-domain will often be omitted (e.g., we write $C_{0}(Z)$ instead of $C_{0}(Z ; \mathbb{R})$ ).
$\mathcal{C}$ represents a generic positive constant, whose value may change from expression to expression, and $\varepsilon$ stands for a positive small parameter, often considered as taking its values on a positive sequence converging to zero; in this case, $\varepsilon^{\prime}$ represents a subsequence of $\varepsilon$, and we write $\varepsilon^{\prime} \prec \varepsilon$.

### 2.2. Measure theory

For $m \in \mathbb{N}$, the $m$-dimensional Lebesgue measure is denoted by $\mathcal{L}^{m}$.
The Borel $\sigma$-algebra on $Z$ is denoted by $\mathcal{B}(Z)$, and $\mathcal{M}\left(Z ; \mathbb{R}^{m}\right)$ is the Banach space of all bounded Radon measures $\lambda: \mathcal{B}(Z) \rightarrow \mathbb{R}^{m}$ endowed with the total variation norm $\|\cdot\|$.
If $\varphi \in C_{0}(Z)$ and $\lambda=\left(\lambda_{1}, \cdots, \lambda_{m}\right) \in \mathcal{M}\left(Z ; \mathbb{R}^{m}\right)$, then we set

$$
\int_{Z} \varphi(z) \mathrm{d} \lambda(z):=\left(\int_{Z} \varphi(z) \mathrm{d} \lambda_{1}(z), \cdots, \int_{Z} \varphi(z) \mathrm{d} \lambda_{m}(z)\right)
$$

If $\varphi=\left(\varphi_{1}, \cdots, \varphi_{m}\right) \in C_{0}\left(Z ; \mathbb{R}^{m}\right)$ and $\lambda \in \mathcal{M}(Z ; \mathbb{R})$, then we define

$$
\int_{Z} \varphi(z) \mathrm{d} \lambda(z):=\left(\int_{Z} \varphi_{1}(z) \mathrm{d} \lambda(z), \cdots, \int_{Z} \varphi_{m}(z) \mathrm{d} \lambda(z)\right)
$$

We write $\mathcal{M}_{\#}\left(Y_{1} \times \cdots \times Y_{n} ; \mathbb{R}^{m}\right)$ and $\mathcal{M}_{y \#}\left(Z \times Y_{1} \times \cdots \times Y_{n} ; \mathbb{R}^{m}\right)$ to denote the duals of $C_{\#}\left(Y_{1} \times \cdots \times Y_{n} ; \mathbb{R}^{m}\right)$ and $C_{0}\left(Z ; C_{\#}\left(Y_{1} \times \cdots \times Y_{n} ; \mathbb{R}^{m}\right)\right)$, respectively.

Let $E \subset \mathbb{R}^{n}$ be a Borel set and let $\mu: \mathcal{B}(E) \rightarrow[0, \infty]$ be a positive Radon measure. If $\lambda \in \mathcal{M}\left(E ; \mathbb{R}^{m}\right)$, then (see for example, [37]) by Lebesgue Decomposition Theorem we can decompose $\lambda$ as $\lambda=\lambda^{a c}+\lambda^{s}=$ $\frac{\mathrm{d} \lambda^{a c}}{\mathrm{~d} \mu} \mu_{\lfloor E}+\lambda^{s}$, where $\lambda^{a c}$ is absolutely continuous with respect to $\mu, \lambda^{s}$ and $\mu$ are mutually singular.

### 2.3. The space of functions of bounded variation

A function $u: \Omega \rightarrow \mathbb{R}^{d}, d \in \mathbb{N}$, is said to be a function of bounded variation, and we write $u \in B V\left(\Omega ; \mathbb{R}^{d}\right)$, if $u \in L^{1}\left(\Omega ; \mathbb{R}^{d}\right)$ and its distributional derivative $D u$ belongs to $\mathcal{M}\left(\Omega ; \mathbb{R}^{d \times N}\right)$, that is, if there exists a measure $D u \in \mathcal{M}\left(\Omega ; \mathbb{R}^{d \times N}\right)$ such that for all $\phi \in C_{c}(\Omega), j \in\{1, \cdots, d\}$ and $i \in\{1, \cdots, N\}$ one has

$$
\int_{\Omega} u_{j}(x) \frac{\partial \phi}{\partial x_{i}}(x) \mathrm{d} x=-\int_{\Omega} \phi(x) \mathrm{d} D_{i} u_{j}(x),
$$

where $u=\left(u_{1}, \cdots, u_{d}\right)$ and $D u_{j}=\left(D_{1} u_{j}, \cdots, D_{N} u_{j}\right)$. The space $B V\left(\Omega ; \mathbb{R}^{d}\right)$ is a Banach space when endowed with the norm $\|u\|_{B V\left(\Omega ; \mathbb{R}^{d}\right)}:=\|u\|_{L^{1}\left(\Omega ; \mathbb{R}^{d}\right)}+\|D u\|(\Omega)$.

We will also consider the space $B V_{\#}\left(Y ; \mathbb{R}^{d}\right):=\left\{u \in B V_{\text {loc }}\left(\mathbb{R}^{N} ; \mathbb{R}^{d}\right): u\right.$ is $Y$-periodic $\}$, endowed with the norm of $B V\left(Y ; \mathbb{R}^{d}\right)$. Notice that if $u \in B V_{\#}\left(Y ; \mathbb{R}^{d}\right)$, then $D u \in \mathcal{M}_{\#}\left(Y ; \mathbb{R}^{d \times N}\right)$.
We will consider the weak-丸 convergence in $B V\left(\Omega ; \mathbb{R}^{d}\right)$. We recall that $\left\{u_{j}\right\}_{j \in \mathbb{N}} \subset B V\left(\Omega ; \mathbb{R}^{d}\right)$ is said to weakly-丸 converge in $B V\left(\Omega ; \mathbb{R}^{d}\right)$ to some $u \in B V\left(\Omega ; \mathbb{R}^{d}\right)$ if $u_{j} \rightarrow u$ (strongly) in $L^{1}\left(\Omega ; \mathbb{R}^{d}\right)$ and $D u_{j}{ }^{\star} D u$ weakly- in $\mathcal{M}\left(\Omega ; \mathbb{R}^{d \times N}\right)$.
If $u \in B V\left(\Omega ; \mathbb{R}^{d}\right)$, then $D u=\nabla u \mathcal{L}^{N}{ }_{\lfloor\Omega}+D^{s} u$ is the Radon-Nikodym decomposition of $D u$ with respect to $\mathcal{L}^{N}{ }_{\lfloor\Omega}$.

### 2.4. Some preliminary results

We start this subsection by recalling the notion of $(n+1)$-convergence for sequences of Radon measures introduced in [3] for $n=1$, and generalized in [35] for any $n \in \mathbb{N}$. Unless stated otherwise, in this subsection we assume that the length scales $\varrho_{1}, \ldots, \varrho_{n}$ only need to satisfy condition (1.1).

Definition 2.1. Let $\left\{\mu_{\varepsilon}\right\}_{\varepsilon>0} \subset \mathcal{M}\left(\Omega ; \mathbb{R}^{m}\right)$ be a sequence of Radon measures with finite total variation on $\Omega$. We say that $\left\{\mu_{\varepsilon}\right\}_{\varepsilon>0}(n+1)$-scale converges to a Radon measure $\mu_{0} \in \mathcal{M}_{y \#}\left(\Omega \times Y_{1} \times \cdots \times Y_{n} ; \mathbb{R}^{m}\right)$ with finite total variation in the product space $\Omega \times Y_{1} \times \cdots \times Y_{n}$, where each $Y_{i}$ is a copy of $Y$, if for all $\varphi \in C_{0}\left(\Omega ; C_{\#}\left(Y_{1} \times \cdots \times Y_{n} ; \mathbb{R}^{m}\right)\right)$ we have

$$
\lim _{\varepsilon \rightarrow 0^{+}} \int_{\Omega} \varphi\left(x, \frac{x}{\varrho_{1}(\varepsilon)}, \cdots, \frac{x}{\varrho_{n}(\varepsilon)}\right) \cdot \mathrm{d} \mu_{\varepsilon}(x)=\int_{\Omega \times Y_{1} \times \cdots \times Y_{n}} \varphi\left(x, y_{1}, \cdots, y_{n}\right) \cdot \mathrm{d} \mu_{0}\left(x, y_{1}, \cdots, y_{n}\right),
$$

in which case we write $\mu_{\varepsilon} \xrightarrow[\varepsilon]{(n+1)-s c} \mu_{0}$.
This notion of convergence is justified by a compactness result, which asserts that every bounded sequence in $\mathcal{M}\left(\Omega ; \mathbb{R}^{m}\right)$ admits a $(n+1)$-scale converging subsequence (see [35, Thm 3.2]). The (usual) weak-^ limit in $\mathcal{M}\left(\Omega ; \mathbb{R}^{m}\right)$ is the projection on $\Omega$ of the $(n+1)$-scale limit, and so the latter captures more information on the oscillatory behavior of a bounded sequence in $\mathcal{M}\left(\Omega ; \mathbb{R}^{m}\right)$ than the former (see [35, Prop. 3.3]).

In order to characterize the $(n+1)$-scale limits of $\left\{\left(u_{\varepsilon} \mathcal{L}^{N}{ }_{\lfloor\Omega}, D u_{\varepsilon\lfloor\Omega}\right)\right\}_{\varepsilon>0} \subset \mathcal{M}\left(\Omega ; \mathbb{R}^{d}\right) \times \mathcal{M}\left(\Omega ; \mathbb{R}^{d \times N}\right)$, whenever $\left\{u_{\varepsilon}\right\}_{\varepsilon>0}$ is a bounded sequence in $B V\left(\Omega ; \mathbb{R}^{d}\right)$ we introduce the following subspace of $B V_{\#}\left(Y ; \mathbb{R}^{d}\right)$ valued Radon measures measures.

Definition 2.2. For $i \in \mathbb{N}$, define the space $\mathcal{M}_{\star}\left(\Omega \times Y_{1} \times \cdots \times Y_{i-1} ; B V_{\#}\left(Y_{i} ; \mathbb{R}^{d}\right)\right)$ of all $B V_{\#}\left(Y_{i} ; \mathbb{R}^{d}\right)$-valued Radon measures $\boldsymbol{\mu} \in \mathcal{M}\left(\Omega \times Y_{1} \times \cdots \times Y_{i-1} ; B V_{\#}\left(Y_{i} ; \mathbb{R}^{d}\right)\right)$ with finite total variation, for which there exists a $\mathbb{R}^{d \times N}$-valued Radon measure $\lambda \in \mathcal{M}_{y \#}\left(\Omega \times Y_{1} \times \cdots \times Y_{i} ; \mathbb{R}^{d \times N}\right)$, with finite total variation in the product space $\Omega \times Y_{1} \times \cdots \times Y_{i}$, such that for all $B \in \mathcal{B}\left(\Omega \times Y_{1} \times \cdots \times Y_{i-1}\right), E \in \mathcal{B}\left(Y_{i}\right)$,

$$
\left(D_{y_{i}}(\boldsymbol{\mu}(B))\right)(E)=\lambda(B \times E) .
$$

We say that $\lambda$ is the measure associated with $D_{y_{i}} \boldsymbol{\mu}$.
A simple example of a measure in the space $\mathcal{M}_{\star}\left(\Omega \times Y_{1} \times \cdots \times Y_{i-1} ; B V_{\#}\left(Y_{i} ; \mathbb{R}^{d}\right)\right), i \in \mathbb{N}$, is the following. For simplicity, assume $i=1$, and let $\tau \in \mathcal{M}(\Omega ; \mathbb{R})$ be a real-valued Radon measure with finite total variation, let $v \in B V_{\#}\left(Y ; \mathbb{R}^{d}\right)$, and consider the mapping $\boldsymbol{\mu}: B \in \mathcal{B}(\Omega) \mapsto \tau(B) v \in B V_{\#}\left(Y ; \mathbb{R}^{d}\right)$. Then $\boldsymbol{\mu} \in \mathcal{M}_{*}\left(\Omega ; B V_{\#}\left(Y ; \mathbb{R}^{d}\right)\right)$, and $\lambda:=\tau \otimes D v \in \mathcal{M}_{y \#}\left(\Omega \times Y ; \mathbb{R}^{d \times N}\right)$ is the measure associated with $D_{y} \boldsymbol{\mu}: B \in$ $\mathcal{B}(\Omega) \mapsto D_{y}(\boldsymbol{\mu}(B))=\tau(B) D v$ in the sense of Definition 2.2, that is, $\langle\lambda, \varphi\rangle:=\int_{\Omega \times Y} \varphi(x, y) \mathrm{d} \tau(x) \mathrm{d} D v(y)$, $\varphi \in C_{0}\left(\Omega ; C_{\#}\left(Y ; \mathbb{R}^{d \times N}\right)\right)$.
We refer the reader to [35] for more detailed considerations on the space $\mathcal{M}_{\star}\left(\Omega \times Y_{1} \times \cdots \times Y_{i-1} ; B V_{\#}\left(Y_{i} ; \mathbb{R}^{d}\right)\right)$, $i \in \mathbb{N}$. The following result holds (see [35, Thm. 1.10]).

Theorem 2.3. Let $\left\{u_{\varepsilon}\right\}_{\varepsilon>0} \subset B V\left(\Omega ; \mathbb{R}^{d}\right)$ be such that $u_{\varepsilon} \stackrel{\star}{\rightharpoonup} u$ weakly-ᄎ in $B V\left(\Omega ; \mathbb{R}^{d}\right)$ as $\varepsilon \rightarrow 0^{+}$, for some $u \in B V\left(\Omega ; \mathbb{R}^{d}\right)$. Assume that, in addition to satisfying (1.1), the length scales $\varrho_{1}, \ldots, \varrho_{n}$ are well separated, i.e., satisfy condition (1.2). Then
a) $u_{\varepsilon} \mathcal{L}^{N}{ }_{\lfloor\Omega} \frac{(n+1)-s c}{\varepsilon} \tau_{u}$, where $\tau_{u} \in \mathcal{M}_{y \#}\left(\Omega \times Y_{1} \times \cdots \times Y_{n} ; \mathbb{R}^{d}\right)$ is the measure defined by

$$
\tau_{u}:=u \mathcal{L}^{N}{ }_{\lfloor\Omega} \otimes \mathcal{L}_{y_{1}, \cdots, y_{n}}^{n N},
$$

i.e., if $\varphi \in C_{0}\left(\Omega ; C_{\#}\left(Y_{1} \times \cdots \times Y_{n} ; \mathbb{R}^{d}\right)\right)$ then

$$
\left\langle\tau_{u}, \varphi\right\rangle=\int_{\Omega \times Y_{1} \times \cdots \times Y_{n}} \varphi\left(x, y_{1}, \cdots, y_{n}\right) \cdot u(x) \mathrm{d} x \mathrm{~d} y_{1} \cdots \mathrm{~d} y_{n}
$$

b) there exist a subsequence $\left\{D u_{\varepsilon^{\prime}}\right\}$ of $\left\{D u_{\varepsilon}\right\}$ and, for all $i \in\{1, \cdots, n\}$, measures $\boldsymbol{\mu}_{i} \in \mathcal{M}_{\star}\left(\Omega \times Y_{1} \times\right.$ $\left.\cdots \times Y_{i-1} ; B V_{\#}\left(Y_{i} ; \mathbb{R}^{d}\right)\right)$ such that

$$
D u_{\varepsilon^{\prime}} \xrightarrow[\varepsilon^{\prime}]{(n+1)-s c} \lambda_{u, \mu_{1}, \cdots, \mu_{n}},
$$

where $\lambda_{u, \mu_{1}, \cdots, \mu_{n}} \in \mathcal{M}_{y \#}\left(\Omega \times Y_{1} \times \cdots \times Y_{n} ; \mathbb{R}^{d \times N}\right)$ is the measure given by

$$
\begin{equation*}
\lambda_{u, \mu_{1}, \cdots, \mu_{n}}:=D u_{\lfloor\Omega} \otimes \mathcal{L}_{y_{1}, \cdots, y_{n}}^{n N}+\sum_{i=1}^{n-1} \lambda_{i} \otimes \mathcal{L}_{y_{i+1}, \cdots, y_{n}}^{(n-i) N}+\lambda_{n} \tag{2.1}
\end{equation*}
$$

i．e．，if $\varphi \in C_{0}\left(\Omega ; C_{\#}\left(Y_{1} \times \cdots \times Y_{n} ; \mathbb{R}^{d \times N}\right)\right)$ then

$$
\begin{aligned}
\left\langle\lambda_{u, \mu_{1}, \cdots, \boldsymbol{\mu}_{n}}, \varphi\right\rangle= & \int_{\Omega \times Y_{1} \times \cdots \times Y_{n}} \varphi\left(x, y_{1}, \cdots, y_{n}\right): \mathrm{d} D u(x) \mathrm{d} y_{1} \cdots \mathrm{~d} y_{n} \\
& +\sum_{i=1}^{n-1} \int_{\Omega \times Y_{1} \times \cdots \times Y_{n}} \varphi\left(x, y_{1}, \cdots, y_{n}\right): \mathrm{d} \lambda_{i}\left(x, y_{1}, \cdots, y_{i}\right) \mathrm{d} y_{i+1} \cdots \mathrm{~d} y_{n} \\
& +\int_{\Omega \times Y_{1} \times \cdots \times Y_{n}} \varphi\left(x, y_{1}, \cdots, y_{n}\right): \mathrm{d} \lambda_{n}\left(x, y_{1}, \cdots, y_{n}\right),
\end{aligned}
$$

and each $\lambda_{i} \in \mathcal{M}_{y \#}\left(\Omega \times Y_{1} \times \cdots \times Y_{i} ; \mathbb{R}^{d \times N}\right)$ is the measure associated with $D_{y_{i}} \boldsymbol{\mu}_{i}, i \in\{1, \cdots, n\}$ ．
The next result shows that Theorem 2.3 fully characterizes the $(n+1)$－scale limit of bounded sequences in $B V\left(\Omega ; \mathbb{R}^{d}\right)$（see［35，Prop．1．11］）．

Proposition 2．4．Let $u \in B V\left(\Omega ; \mathbb{R}^{d}\right)$ and for $i \in\{1, \cdots, n\}$ ，let $\mu_{i} \in \mathcal{M}_{\star}\left(\Omega \times Y_{1} \times \cdots \times Y_{i-1} ; B V_{\#}\left(Y_{i} ; \mathbb{R}^{d}\right)\right)$ ． Then there exists a bounded sequence $\left\{u_{\varepsilon}\right\}_{\varepsilon>0} \subset B V\left(\Omega ; \mathbb{R}^{d}\right)$ for which a）and b）of Theorem 2.3 hold（with $\varepsilon^{\prime}$ replaced by $\varepsilon$ ）．

Remark 2．5．Since every $(n+1)$－scale convergent sequence in $\mathcal{M}\left(\Omega ; \mathbb{R}^{m}\right)$ is also a weakly－丸 convergent sequence in the sense of measures（see［35，Prop．3．3］），it follows that any such sequence is bounded in $\mathcal{M}\left(\Omega ; \mathbb{R}^{m}\right)$ ．

We now recall a density type result proved in［35，Prop．3．14］，which will play an important role in the proof of our main results．

Proposition 2．6．Let $\Omega \subset \mathbb{R}^{N}$ be an open and bounded set such that $\partial \Omega$ is Lipschitz．Let $u \in B V\left(\Omega ; \mathbb{R}^{d}\right)$ ， and for each $i \in\{1, \cdots, n\}$ ，let $\mu_{i} \in \mathcal{M}_{\star}\left(\Omega \times Y_{1} \times \cdots \times Y_{i-1} ; B V_{\#}\left(Y_{i} ; \mathbb{R}^{d}\right)\right)$ ．Then there exist sequences $\left\{u_{j}\right\}_{j \in \mathbb{N}} \subset C^{\infty}\left(\bar{\Omega} ; \mathbb{R}^{d}\right)$ and $\left\{\psi_{j}^{(i)}\right\}_{j \in \mathbb{N}} \subset C_{c}^{\infty}\left(\Omega ; C_{\#}^{\infty}\left(Y_{1} \times \cdots \times Y_{i} ; \mathbb{R}^{d}\right)\right)$ satisfying

$$
\begin{align*}
& u_{j} \stackrel{\star}{ }_{j} u \text { weakly-丸 in } B V\left(\Omega ; \mathbb{R}^{d}\right), \quad \lim _{j \rightarrow \infty} \int_{\Omega}\left|\nabla u_{j}(x)\right| \mathrm{d} x=\|D u\|(\Omega), \\
& \left(\nabla u_{j}+\sum_{i=1}^{n} \nabla_{y_{i}} \psi_{j}^{(i)}\right) \mathcal{L}^{(n+1) N}{ }_{\left\lfloor\Omega \times Y_{1} \times \cdots \times Y_{n}\right.} \stackrel{\star}{*}_{j} \\
& \stackrel{\star}{ }_{j} \lambda_{u, \boldsymbol{\mu}_{1}, \ldots, \boldsymbol{\mu}_{n}} \text { weakly-太 in } \mathcal{M}_{y \#}\left(\Omega \times Y_{1} \times \cdots \times Y_{n} ; \mathbb{R}^{d \times N}\right) \text {, }  \tag{2.2}\\
& \lim _{j \rightarrow \infty} \int_{\Omega \times Y_{1} \times \cdots \times Y_{n}}\left|\nabla u_{j}(x)+\sum_{i=1}^{n} \nabla_{y_{i}} \psi_{j}^{(i)}\left(x, y_{1}, \cdots, y_{i}\right)\right| \mathrm{d} x \mathrm{~d} y_{1} \cdots \mathrm{~d} y_{n} \\
& =\left\|\lambda_{u, \mu_{1}, \ldots, \mu_{n}}\right\|\left(\Omega \times Y_{1} \times \cdots \times Y_{n}\right),
\end{align*}
$$

where $\lambda_{u, \mu_{1}, \ldots, \boldsymbol{\mu}_{n}}$ is the measure defined in（2．1），and

$$
\begin{gather*}
\tilde{\lambda}_{j} \stackrel{\star}{\rightharpoonup} \tilde{\lambda}_{u, \boldsymbol{\mu}_{1}, \cdots, \boldsymbol{\mu}_{n}} \text { weakly-ᄎ in } \mathcal{M}_{y \#}\left(\Omega \times Y_{1} \times \cdots \times Y_{n} ; \mathbb{R}^{d \times N} \times \mathbb{R}\right), \\
\lim _{j \rightarrow \infty}\left\|\tilde{\lambda}_{j}\right\|\left(\Omega \times Y_{1} \times \cdots \times Y_{n}\right)=\left\|\tilde{\lambda}_{u, \boldsymbol{\mu}_{1}, \cdots, \boldsymbol{\mu}_{n}}\right\|\left(\Omega \times Y_{1} \times \cdots \times Y_{n}\right), \tag{2.3}
\end{gather*}
$$

where, for any $B \in \mathcal{B}\left(\Omega \times Y_{1} \times \cdots \times Y_{n}\right)$,

$$
\begin{aligned}
& \tilde{\lambda}_{j}(B):=\left(\int_{B}\left(\nabla u_{j}(x)+\sum_{i=1}^{n} \nabla_{y_{i}} \psi_{j}^{(i)}\left(x, y_{1}, \cdots, y_{i}\right)\right) \mathrm{d} x \mathrm{~d} y_{1} \cdots \mathrm{~d} y_{n}, \mathcal{L}^{(n+1) N}(B)\right), \\
& \tilde{\lambda}_{u, \boldsymbol{\mu}_{1}, \cdots, \boldsymbol{\mu}_{n}}(B):=\left(\lambda_{u, \mu_{1}, \cdots, \boldsymbol{\mu}_{n}}(B), \mathcal{L}^{(n+1) N}(B)\right) .
\end{aligned}
$$

We finish this subsection by proving some auxiliary results that will be used to establish integral representations for the multiple-scale functional $F^{\mathrm{sc}}$ in (1.4) and for the homogenized functional $F^{\text {hom }}$ in (1.5).

We first introduce some notation. Fix $k \in \mathbb{N}$ and let $g: \mathbb{R}^{k N} \times \mathbb{R}^{d \times N} \rightarrow \overline{\mathbb{R}}$ be a Borel function. We recall that the effective domain of $g, \operatorname{dom}_{e} g$, is the set

$$
\operatorname{dom}_{e} g:=\left\{\left(y_{1}, \cdots, y_{k}, \xi\right) \in \mathbb{R}^{k N} \times \mathbb{R}^{d \times N}: g\left(y_{1}, \cdots, y_{k}, \xi\right)<\infty\right\}
$$

while the conjugate function of $g$ is the function $g^{*}: \mathbb{R}^{k N} \times \mathbb{R}^{d \times N} \rightarrow \overline{\mathbb{R}}$ defined by

$$
\begin{equation*}
g^{*}\left(y_{1}, \cdots, y_{k}, \xi^{*}\right):=\sup _{\xi \in \mathbb{R}^{d \times N}}\left\{\xi: \xi^{*}-g\left(y_{1}, \cdots, y_{k}, \xi\right)\right\}, \quad y_{1}, \ldots, y_{k} \in \mathbb{R}^{N}, \xi^{*} \in \mathbb{R}^{d \times N}, \tag{2.4}
\end{equation*}
$$

and the biconjugate function of $g$ is the function $g^{* *}: \mathbb{R}^{k N} \times \mathbb{R}^{d \times N} \rightarrow \overline{\mathbb{R}}$ defined by

$$
\begin{equation*}
g^{* *}\left(y_{1}, \cdots, y_{k}, \xi\right):=\sup _{\xi^{*} \in \mathbb{R}^{d \times N}}\left\{\xi^{*}: \xi-g^{*}\left(y_{1}, \cdots, y_{k}, \xi^{*}\right)\right\}, \quad y_{1}, \ldots, y_{k} \in \mathbb{R}^{N}, \xi^{*} \in \mathbb{R}^{d \times N} \tag{2.5}
\end{equation*}
$$

We define a function $g_{\mathrm{hom}_{k}}: \mathbb{R}^{(k-1) N} \times \mathbb{R}^{d \times N} \rightarrow \overline{\mathbb{R}}$ by setting

$$
\begin{equation*}
g_{\operatorname{hom}_{k}}\left(y_{1}, \cdots, y_{k-1}, \xi\right):=\inf \left\{\int_{Y_{k}} g\left(y_{1}, \cdots, y_{k-1}, y_{k}, \xi+\nabla \psi_{k}\left(y_{k}\right)\right) \mathrm{d} y_{k}: \psi_{k} \in W_{\#}^{1,1}\left(Y_{k} ; \mathbb{R}^{d}\right)\right\} \tag{2.6}
\end{equation*}
$$

for $y_{1}, \ldots, y_{k-1} \in \mathbb{R}^{N}, \xi \in \mathbb{R}^{d \times N}$.
Let $f: \mathbb{R}^{n N} \times \mathbb{R}^{d \times N} \rightarrow \mathbb{R}$ be a Borel function. If $n=1$, we set $f_{\text {hom }}:=f_{\text {hom }_{1}}$, where $f_{\text {hom }_{1}}$ is given by (2.6) for $k=1$ and with $g$ replaced by $f$, that is,

$$
f_{\text {hom }}(\xi):=\inf \left\{\int_{Y_{1}} f\left(y_{1}, \xi+\nabla \psi_{1}\left(y_{1}\right)\right) \mathrm{d} y_{1}: \psi_{1} \in W_{\#}^{1,1}\left(Y_{1} ; \mathbb{R}^{d}\right)\right\}
$$

If $n=2$, we define $f_{\text {hom }}:=\left(f_{\text {hom }_{2}}\right)_{\text {hom }_{1}}$, which is the function given by (2.6) for $k=1$ and with $g$ replaced by $f_{\text {hom }_{2}}$, where the latter is the function given by (2.6) for $k=2$ and with $g$ replaced by $f$. Precisely,

$$
f_{\mathrm{hom}}(\xi):=\inf \left\{\int_{Y_{1}} f_{\mathrm{hom}_{2}}\left(y_{1}, \xi+\nabla \psi_{1}\left(y_{1}\right)\right) \mathrm{d} y_{1}: \psi_{1} \in W_{\#}^{1,1}\left(Y_{1} ; \mathbb{R}^{d}\right)\right\}
$$

where

$$
f_{\mathrm{hom}_{2}}\left(y_{1}, \xi\right):=\inf \left\{\int_{Y_{2}} f\left(y_{1}, y_{2}, \xi+\nabla \psi_{2}\left(y_{2}\right)\right) \mathrm{d} y_{2}: \psi_{2} \in W_{\#}^{1,1}\left(Y_{2} ; \mathbb{R}^{d}\right)\right\}
$$

Similarly, if $n=3$ we define $f_{\text {hom }}:=\left(\left(f_{\text {hom }_{3}}\right)_{\text {hom }_{2}}\right)_{\text {hom }_{1}}$, i.e.,

$$
f_{\mathrm{hom}}(\xi):=\inf \left\{\int_{Y_{1}}\left(f_{\mathrm{hom}_{3}}\right)_{\text {hom }_{2}}\left(y_{1}, \xi+\nabla \psi_{1}\left(y_{1}\right)\right) \mathrm{d} y_{1}: \psi_{1} \in W_{\#}^{1,1}\left(Y_{1} ; \mathbb{R}^{d}\right)\right\}
$$

where

$$
\left(f_{\mathrm{hom}_{3}}\right)_{\mathrm{hom}_{2}}\left(y_{1}, \xi\right):=\inf \left\{\int_{Y_{2}} f_{\mathrm{hom}_{3}}\left(y_{1}, y_{2}, \xi+\nabla \psi_{2}\left(y_{2}\right)\right) \mathrm{d} y_{2}: \psi_{2} \in W_{\#}^{1,1}\left(Y_{2} ; \mathbb{R}^{d}\right)\right\}
$$

with

$$
f_{\text {hom }_{3}}\left(y_{1}, y_{2}, \xi\right):=\inf \left\{\int_{Y_{3}} f\left(y_{1}, y_{2}, y_{3}, \xi+\nabla \psi_{3}\left(y_{3}\right)\right) \mathrm{d} y_{3}: \psi_{3} \in W_{\#}^{1,1}\left(Y_{3} ; \mathbb{R}^{d}\right)\right\} .
$$

Recursively, for $n \in \mathbb{N}$ we set

$$
\begin{equation*}
f_{\text {hom }}:=\left(\left(f_{\text {hom }_{n}}\right)_{\text {hom }_{n-1} \ldots}\right)_{\text {hom }_{1}} . \tag{2.7}
\end{equation*}
$$

The next two lemmas provide sufficient conditions under which equality $\left(f_{\text {hom }}\right)^{\infty}=\left(f^{\infty}\right)_{\text {hom }}$ holds.
Lemma 2.7. Let $f: \mathbb{R}^{N} \times \mathbb{R}^{N} \times \mathbb{R}^{d \times N} \rightarrow \mathbb{R}$ be a Borel function satisfying conditions $(\mathcal{F} 1)-(\mathcal{F} 4)$ and $(\mathcal{F} 8)$. Then,

$$
\begin{equation*}
\left(f_{\text {hom }}\right)^{\infty}=\left(f^{\infty}\right)_{\text {hom }} . \tag{2.8}
\end{equation*}
$$

Proof. We start by observing that, arguing as in [6, Thm. 4], we can prove a similar result to [14, Lemme 3.5]: If $h: \mathbb{R}^{N} \times \mathbb{R}^{N} \times \mathbb{R}^{d \times N} \rightarrow \mathbb{R}$ is a Borel function satisfying hypotheses $(\mathcal{F} 1)-(\mathcal{F} 4)$, then for all $y_{1} \in \mathbb{R}^{N}, \xi^{*} \in \mathbb{R}^{d \times N}$ (see (2.4) and (2.6)),

$$
\begin{equation*}
\left(h_{\mathrm{hom}_{2}}\right)^{*}\left(y_{1}, \xi^{*}\right)=\inf _{\Psi_{2} \in E_{\#}\left(Y_{2} ; \mathbb{R}^{d \times N}\right)} \int_{Y_{2}} h^{*}\left(y_{1}, y_{2}, \xi^{*}+\Psi_{2}\left(y_{2}\right)\right) \mathrm{d} y_{2} \tag{2.9}
\end{equation*}
$$

where, for $k \in \mathbb{N}$,

$$
\begin{aligned}
& E_{\#}\left(Y_{k} ; \mathbb{R}^{d \times N}\right):=\left\{\Psi=\left(\Psi_{i j}\right) \in L_{\#}^{\infty}\left(Y_{k} ; \mathbb{R}^{d \times N}\right):\right. \\
&\left.\int_{Y_{k}} \Psi\left(y_{k}\right) \mathrm{d} y_{k}=0, \operatorname{div} \Psi_{i}=0 \text { for all } i \in\{1, \cdots, d\}\right\} .
\end{aligned}
$$

Similarly, since $h_{\mathrm{hom}_{2}}: \mathbb{R}^{N} \times \mathbb{R}^{d \times N} \rightarrow \mathbb{R}$ is also a Borel function satisfying conditions $(\mathcal{F} 1)-(\mathcal{F} 4)$, we have that for all $\xi^{*} \in \mathbb{R}^{d \times N}$,

$$
\begin{equation*}
\left(h_{\mathrm{hom}}\right)^{*}\left(\xi^{*}\right)=\inf _{\Psi_{1} \in E_{\#}\left(Y_{1} ; \mathbb{R}^{d \times N}\right)} \int_{Y_{1}}\left(h_{\mathrm{hom}_{2}}\right)^{*}\left(y_{1}, \xi^{*}+\Psi_{1}\left(y_{1}\right)\right) \mathrm{d} y_{1} . \tag{2.10}
\end{equation*}
$$

Moreover, for all $y_{1}, y_{2} \in \mathbb{R}^{N}, \xi \in \mathbb{R}^{d \times N}$ (see, for example, [46, Thm. 13.3, Lemma 7.42]),

$$
\begin{equation*}
h^{\infty}\left(y_{1}, y_{2}, \xi\right)=\sup _{\left(y_{1}, y_{2}, \xi^{*}\right) \in \operatorname{dom}_{e} h^{*}} \xi: \xi^{*}, \quad\left(h_{\mathrm{hom}_{2}}\right)^{\infty}\left(y_{1}, \xi\right)=\sup _{\left(y_{1}, \xi^{*}\right) \in \operatorname{dom}_{e}\left(h_{\mathrm{hom}_{2}}\right)^{*}} \xi: \xi^{*} . \tag{2.11}
\end{equation*}
$$

If, in addition, $h^{*}$ is bounded from above in $\operatorname{dom}_{e} h^{*}$, then we claim that for all $y_{1}, y_{2} \in \mathbb{R}^{N}, \xi^{*} \in \mathbb{R}^{d \times N}$,

$$
\left(h^{\infty}\right)^{*}\left(y_{1}, y_{2}, \xi^{*}\right)= \begin{cases}0 & \text { if }\left(y_{1}, y_{2}, \xi^{*}\right) \in \operatorname{dom}_{e} h^{*}  \tag{2.12}\\ \infty & \text { otherwise }\end{cases}
$$

Indeed, under this additional hypothesis, we have that for each $y_{1}, y_{2} \in \mathbb{R}^{N}$ the set $\left\{\xi^{*} \in \mathbb{R}^{d \times N}:\left(y_{1}, y_{2}, \xi^{*}\right) \in\right.$ $\left.\operatorname{dom}_{e} h^{*}\right\}$ is convex and closed. Hence (see, for example, [33], [46]), the indicator function $\chi_{\text {dom }_{e} h^{*}}$, that is, the function defined by

$$
\chi_{\operatorname{dom}_{e} h^{*}}\left(y_{1}, y_{2}, \xi^{*}\right):= \begin{cases}0 & \text { if }\left(y_{1}, y_{2}, \xi^{*}\right) \in \operatorname{dom}_{e} h^{*} \\ \infty & \text { otherwise }\end{cases}
$$

coincides with its biconjugate function $\left(\chi_{\operatorname{dom}_{e} h^{*}}\right)^{* *}$. On the other hand, defining for each $t>0$,

$$
h_{t}\left(y_{1}, y_{2}, \xi\right):=\frac{h\left(y_{1}, y_{2}, t \xi\right)-h\left(y_{1}, y_{2}, 0\right)}{t}, y_{1}, y_{2} \in \mathbb{R}^{N}, \xi \in \mathbb{R}^{d \times N}
$$

due to the convexity hypothesis we have that for all $y_{1}, y_{2} \in \mathbb{R}^{N}, \xi \in \mathbb{R}^{d \times N}, t \in \mathbb{R}^{+} \mapsto h_{t}\left(y_{1}, y_{2}, \xi\right)$ is nondecreasing and

$$
\sup _{t>0} h_{t}\left(y_{1}, y_{2}, \xi\right)=\lim _{t \rightarrow \infty} h_{t}\left(y_{1}, y_{2}, \xi\right)=h^{\infty}\left(y_{1}, y_{2}, \xi\right) .
$$

Furthermore, it can be shown that for all $y_{1}, y_{2} \in \mathbb{R}^{N}, \xi, \xi^{*} \in \mathbb{R}^{d \times N}$,

$$
\begin{aligned}
& \inf _{t>0} h_{t}^{*}\left(y_{1}, y_{2}, \xi^{*}\right)=\lim _{t \rightarrow \infty} h_{t}^{*}\left(y_{1}, y_{2}, \xi^{*}\right)=\chi_{\operatorname{dom}_{e} h^{*}}\left(y_{1}, y_{2}, \xi^{*}\right) \\
& \left(\inf _{t>0} h_{t}^{*}\right)^{* *}\left(y_{1}, y_{2}, \xi\right)=\left(\sup _{t>0} h_{t}\right)^{*}\left(y_{1}, y_{2}, \xi\right)=\left(h^{\infty}\right)^{*}\left(y_{1}, y_{2}, \xi\right)
\end{aligned}
$$

so that (2.12) follows from the equality $\left(\chi_{\text {dom }_{e} h^{*}}\right)^{* *}=\chi_{\operatorname{dom}_{e} h^{*}}$.
We now establish equality (2.8) in two steps. Notice that both $f_{\text {hom }_{2}}$ and $f_{\text {hom }}$, as well as their respective recession functions, are real-valued Borel functions satisfying similar conditions to $(\mathcal{F} 1)-(\mathcal{F} 4)$.

Step 1. We prove that $\left(f_{\text {hom }_{2}}\right)^{\infty}=\left(f^{\infty}\right)_{\text {hom }_{2}}$.
Inequality $\left(f_{\mathrm{hom}_{2}}\right)^{\infty} \leqslant\left(f^{\infty}\right)_{\text {hom }_{2}}$ follows from the definitions of both functions and using Lebesgue Dominated Convergence Theorem taking into account $(\mathcal{F} 3)$ and $(\mathcal{F} 4)$.

We claim that to prove that $\left(f_{\text {hom }_{2}}\right)^{\infty} \geqslant\left(f^{\infty}\right)_{\text {hom }_{2}}$, it suffices to show that

$$
\begin{equation*}
\operatorname{dom}_{e}\left(f_{\mathrm{hom}_{2}}\right)^{*} \supset \operatorname{dom}_{e}\left(\left(f^{\infty}\right)_{\mathrm{hom}_{2}}\right)^{*} . \tag{2.13}
\end{equation*}
$$

In fact, if (2.13) holds then by (2.11) we have that

$$
\begin{equation*}
\left(f_{\text {hom }_{2}}\right)^{\infty} \geqslant\left(\left(f^{\infty}\right)_{\text {hom }_{2}}\right)^{\infty} . \tag{2.14}
\end{equation*}
$$

Since $\left(f^{\infty}\right)_{\text {hom }_{2}}$ is positively 1-homogeneous in the last variable, we have that $\left(\left(f^{\infty}\right)_{\text {hom }_{2}}\right)^{\infty}=\left(f^{\infty}\right)_{\text {hom }_{2}}$, which together with $(2.14)$ yields $\left(f_{\text {hom }_{2}}\right)^{\infty} \geqslant\left(f^{\infty}\right)_{\text {hom }_{2}}$.
We now prove (2.13). Let $\left(y_{1}, \xi^{*}\right) \in \operatorname{dom}_{e}\left(\left(f^{\infty}\right)_{\text {hom }_{2}}\right)^{*}$. Then, by (2.9) (with $f$ replaced by $f^{\infty}$ ), there exists $\Psi_{2} \in E_{\#}\left(Y_{2} ; \mathbb{R}^{d \times N}\right)$ such that

$$
\int_{Y_{2}}\left(f^{\infty}\right)^{*}\left(y_{1}, y_{2}, \xi^{*}+\Psi_{2}\left(y_{2}\right)\right) \mathrm{d} y_{2}<\infty
$$

and so (2.12) ensures that for a.e. $y_{2} \in Y_{2}$ we have $\left(y_{1}, y_{2}, \xi^{*}+\Psi_{2}\left(y_{2}\right)\right) \in \operatorname{dom}_{e} f^{*}$. From (2.9) and ( $\left.\mathcal{F} 8\right)$ we conclude that

$$
\left(f_{\mathrm{hom}_{2}}\right)^{*}\left(y_{1}, \xi^{*}\right) \leqslant \int_{Y_{2}} f^{*}\left(y_{1}, y_{2}, \xi^{*}+\Psi_{2}\left(y_{2}\right)\right) \mathrm{d} y_{2} \leqslant \mathcal{C}<\infty .
$$

Thus, $\left(y_{1}, \xi^{*}\right) \in \operatorname{dom}_{e}\left(g_{\mathrm{hom}_{2}}\right)^{*}$, which proves (2.13). So, $\left(f_{\mathrm{hom}_{2}}\right)^{\infty}=\left(f^{\infty}\right)_{\mathrm{hom}_{2}}$ and, consequently,

$$
\begin{equation*}
\left(\left(f_{\mathrm{hom}_{2}}\right)^{\infty}\right)_{\mathrm{hom}_{1}}=\left(\left(f^{\infty}\right)_{\mathrm{hom}_{2}}\right)_{\mathrm{hom}_{1}}=\left(f^{\infty}\right)_{\mathrm{hom}} \tag{2.15}
\end{equation*}
$$

where in the last equality we used definition (2.7).
Step 2. We prove that $\left(f_{\text {hom }}\right)^{\infty}=\left(f^{\infty}\right)_{\text {hom }}$.
It suffices to observe that $(\mathcal{F} 3),(\mathcal{F} 8)$ and $(2.9)$ imply that $\left(f_{\text {hom }_{2}}\right)^{*}$ is also bounded on its effective domain. Hence, reasoning as before and in view of (2.10),

$$
\begin{equation*}
\left(\left(f_{\mathrm{hom}_{2}}\right)^{\infty}\right)_{\mathrm{hom}_{1}}=\left(\left(f_{\mathrm{hom}_{2}}\right)_{\mathrm{hom}_{1}}\right)^{\infty}=\left(f_{\mathrm{hom}}\right)^{\infty} \tag{2.16}
\end{equation*}
$$

Thus, from (2.15)-(2.16) we conclude that $\left(f_{\text {hom }}\right)^{\infty}=\left(f^{\infty}\right)_{\text {hom }}$.

Lemma 2.8. Let $f: \mathbb{R}^{N} \times \mathbb{R}^{N} \times \mathbb{R}^{d \times N} \rightarrow \mathbb{R}$ be a Borel function satisfying conditions $(\mathcal{F} 1)$, $(\mathcal{F} 3)$, ( $\left.\mathcal{F} 4\right)^{\prime}$ and ( $\mathcal{F} 7$ ). Then $\left(f_{\text {hom }}\right)^{\infty}=\left(f^{\infty}\right)_{\text {hom }}$.
Proof. Note that $(\mathcal{F} 7)$ is equivalent to requiring that there exist constants $C, L>0$ and $\alpha \in(0,1)$ such that given $y_{1}, y_{2} \in \mathbb{R}^{N}$ and $\xi \in \mathbb{R}^{d \times N}$ arbitrarily, then for all $t \in \mathbb{R}$ such that $t|\xi|>L$,

$$
\begin{equation*}
\left|f^{\infty}\left(y_{1}, y_{2}, \xi\right)-\frac{f\left(y_{1}, y_{2}, t \xi\right)}{t}\right| \leqslant C \frac{|\xi|^{1-\alpha}}{t^{\alpha}} \tag{2.17}
\end{equation*}
$$

We now prove that

$$
\begin{equation*}
\left(f_{\mathrm{hom}_{2}}\right)^{\infty}=\left(f^{\infty}\right)_{\mathrm{hom}_{2}} . \tag{2.18}
\end{equation*}
$$

Inequality $\left(f_{\mathrm{hom}_{2}}\right)^{\infty} \leqslant\left(f^{\infty}\right)_{\text {hom }_{2}}$ follows from the definitions of both functions and Fatou's Lemma taking into account $(\mathcal{F} 3)$ and $(\mathcal{F} 4)^{\prime}$.
Conversely, fix $y_{1} \in \mathbb{R}, \xi \in \mathbb{R}^{d \times N}$. By definition of infimum, for each $t \geqslant 1$ we can find $\psi_{t} \in W_{\#}^{1,1}\left(Y_{2} ; \mathbb{R}^{d}\right)$ such that

$$
\begin{equation*}
\int_{Y_{2}} \frac{f\left(y_{1}, y_{2}, t \xi+t \nabla \psi_{t}\left(y_{2}\right)\right)}{t} \mathrm{~d} y_{2} \leqslant \frac{f_{\mathrm{hom}_{2}}\left(y_{1}, t \xi\right)}{t}+\frac{1}{t} \tag{2.19}
\end{equation*}
$$

In particular, (2.19), together with $(\mathcal{F} 3)$ and $(\mathcal{F} 4)^{\prime}$, yields

$$
\begin{equation*}
\int_{Y_{2}}\left|\xi+\nabla \psi_{t}\left(y_{2}\right)\right| \mathrm{d} y_{2} \leqslant \bar{C}(1+|\xi|) \tag{2.20}
\end{equation*}
$$

for some positive constant $\bar{C}$ independent of $t$.
By definition of $\left(f^{\infty}\right)_{\text {hom }_{2}}$,

$$
\begin{aligned}
\left(f^{\infty}\right)_{\text {hom }_{2}}\left(y_{1}, \xi\right) & \leqslant \int_{Y_{2}} f^{\infty}\left(y_{1}, y_{2}, \xi+\nabla \psi_{t}\left(y_{2}\right)\right) \mathrm{d} y_{2} \\
& \leqslant \frac{C L}{t}+\int_{Y_{2} \cap\left\{y_{2}: t\left|\xi+\nabla \psi_{t}\left(y_{2}\right)\right|>L\right\}} f^{\infty}\left(y_{1}, y_{2}, \xi+\nabla \psi_{t}\left(y_{2}\right)\right) \mathrm{d} y_{2}
\end{aligned}
$$

where we used the fact that in view of $(\mathcal{F} 3), f^{\infty}\left(y_{1}, y_{2}, \xi\right) \leqslant C|\xi|$. Invoking, in addition, (2.17), (F) ${ }^{\prime}$ ' and (2.19), in this order, we have

$$
\begin{align*}
\left(f^{\infty}\right)_{\text {hom }_{2}}\left(y_{1}, \xi\right) & \leqslant \frac{C L}{t}+\int_{Y_{2} \cap\left\{y_{2}: t\left|\xi+\nabla \psi_{t}\left(y_{2}\right)\right|>L\right\}} \frac{f\left(y_{1}, y_{2}, t \xi+t \nabla \psi_{t}\left(y_{2}\right)\right)}{t}+C \frac{\left|\xi+\nabla \psi_{t}\left(y_{2}\right)\right|^{1-\alpha}}{t^{\alpha}} \mathrm{d} y_{2} \\
& \leqslant \frac{C(L+1)}{t}+\int_{Y_{2}} \frac{f\left(y_{1}, y_{2}, t \xi+t \nabla \psi_{t}\left(y_{2}\right)\right)}{t} \mathrm{~d} y_{2}+\frac{C}{t^{\alpha}} \int_{Y_{2}}\left|\xi+\nabla \psi_{t}\left(y_{2}\right)\right|^{1-\alpha} \mathrm{d} y_{2}  \tag{2.21}\\
& \leqslant \frac{C(L+1)+1}{t}+\frac{f_{\text {hom }_{2}}\left(y_{1}, t \xi\right)}{t}+\frac{C}{t^{\alpha}}(\bar{C}(1+|\xi|))^{1-\alpha}
\end{align*}
$$

where in the last estimate we also used Hölder's Inequality together with (2.20). Letting $t \rightarrow \infty$, we conclude that $\left(f^{\infty}\right)_{\text {hom }_{2}} \leqslant\left(f_{\text {hom }_{2}}\right)^{\infty}$. Thus, (2.18) holds. Consequently,

$$
\left(\left(f_{\mathrm{hom}_{2}}\right)^{\infty}\right)_{\mathrm{hom}_{1}}=\left(\left(f^{\infty}\right)_{\mathrm{hom}_{2}}\right)_{\mathrm{hom}_{1}}=\left(f^{\infty}\right)_{\mathrm{hom}}
$$

Next we show that

$$
\begin{equation*}
\left(\left(f_{\mathrm{hom}_{2}}\right)^{\infty}\right)_{\mathrm{hom}_{1}}=\left(\left(f_{\mathrm{hom}_{2}}\right)_{\mathrm{hom}_{1}}\right)^{\infty} \tag{2.22}
\end{equation*}
$$

which will finish the proof since, by definition, $\left(\left(f_{\text {hom }_{2}}\right)_{\text {hom }_{1}}\right)^{\infty}=\left(f_{\text {hom }}\right)^{\infty}$.
In view of the hypotheses on $f$ and using definition (2.6), it can be shown that $f_{\mathrm{hom}_{2}}: \mathbb{R}^{N} \times \mathbb{R}^{d \times N} \rightarrow \mathbb{R}$ is a Borel function satisfying conditions $(\mathcal{F} 1),(\mathcal{F} 3)$ and $(\mathcal{F} 4)^{\prime}$. If we prove that $f_{\text {hom }_{2}}$ also satisfies $(\mathcal{F} 7)$ then, reasoning as in the proof of (2.18), we deduce that (2.22) holds.

Let $C, L>0$ and $\alpha \in(0,1)$ be given by $(\mathcal{F} 7)$ for $f$. Fix $y_{1} \in \mathbb{R}^{N}$ and $\xi \in \mathbb{R}^{d \times N}$ such that $|\xi|=1$. Let $t \geqslant \tilde{L}:=\max \{1, L\}$. Using (2.18) and (2.21), we have

$$
\begin{equation*}
\left(f_{\mathrm{hom}_{2}}\right)^{\infty}\left(y_{1}, \xi\right)-\frac{f_{\mathrm{hom}_{2}}\left(y_{1}, t \xi\right)}{t}=\left(f^{\infty}\right)_{\mathrm{hom}_{2}}\left(y_{1}, \xi\right)-\frac{f_{\mathrm{hom}_{2}}\left(y_{1}, t \xi\right)}{t} \leqslant \frac{C(L+1)+1}{t}+\frac{C}{t^{\alpha}}(2 \bar{C})^{1-\alpha} \leqslant \frac{C_{1}}{t^{\alpha}} \tag{2.23}
\end{equation*}
$$

where $C_{1}$ is a positive constant independent of $t$.
Conversely, for each $0<\delta<1$ we can find $\psi_{\delta} \in W_{\#}^{1,1}\left(Y_{2}, \mathbb{R}^{d}\right)$ such that

$$
\begin{equation*}
\int_{Y_{2}} f^{\infty}\left(y_{1}, y_{2}, \xi+\nabla \psi_{\delta}\left(y_{2}\right)\right) \mathrm{d} y_{2} \leqslant\left(f^{\infty}\right)_{\text {hom }_{2}}\left(y_{1}, \xi\right)+\delta \tag{2.24}
\end{equation*}
$$

so that, in view of $(\mathcal{F} 3)$ and $(\mathcal{F} 4)^{\prime}$,

$$
\begin{equation*}
\frac{1}{C} \int_{Y_{2}}\left|\xi+\nabla \psi_{\delta}\left(y_{2}\right)\right| \mathrm{d} y_{2} \leqslant C|\xi|+\delta<C+1 \tag{2.25}
\end{equation*}
$$

From (2.18), (2.24) and (2.17), and taking into account that $f^{\infty} \geqslant 0$, we conclude that

$$
\begin{align*}
& \frac{f_{\mathrm{hom}_{2}}\left(y_{1}, t \xi\right)}{t}-\left(f_{\mathrm{hom}_{2}}\right)^{\infty}\left(y_{1}, \xi\right) \\
& \leqslant \int_{Y_{2}} \frac{f\left(y_{1}, y_{2}, t \xi+t \nabla \psi_{\delta}\left(y_{2}\right)\right)}{t}-f^{\infty}\left(y_{1}, y_{2}, \xi+\nabla \psi_{\delta}\left(y_{2}\right)\right) \mathrm{d} y_{2}+\delta \\
& \leqslant C \int_{Y_{2}} \frac{\left|\xi+\nabla \psi_{\delta}\left(y_{2}\right)\right|^{1-\alpha}}{t^{\alpha}} \mathrm{d} y_{2}+\int_{Y_{2} \cap\left\{y_{2}: t\left|\xi+\nabla \psi_{\delta}\left(y_{2}\right)\right| \leqslant L\right\}} \frac{f\left(y_{1}, y_{2}, t \xi+t \nabla \psi_{\delta}\left(y_{2}\right)\right)}{t} \mathrm{~d} y_{2}+\delta  \tag{2.26}\\
& \leqslant \frac{C\left(C^{2}+C\right)^{1-\alpha}}{t^{\alpha}}+\frac{C(1+L)}{t}+\delta,
\end{align*}
$$

where in the last inequality we also used Hölder's Inequality together with (2.25), and ( $\mathcal{F} 3$ ). Letting $\delta \rightarrow 0^{+}$ in (2.26), using the fact that $t \geqslant t^{\alpha}$ whenever $t \geqslant 1$ together with (2.23), we deduce that $f_{\mathrm{hom}_{2}}$ satisfies $(\mathcal{F} 7)$.

The next proposition will be used to prove integral representations for the multiple-scale functional $F^{\text {sc }}$ in (1.4) and for the homogenized functional $F^{\text {hom }}$ in (1.5).

Proposition 2.9. Let $f: \mathbb{R}^{n N} \times \mathbb{R}^{d \times N} \rightarrow \mathbb{R}$ be a Borel function satisfying hypotheses $(\mathcal{F} 1),(\mathcal{F} 3)$ and $(\mathcal{F} 4)$. For $\eta>0$, let $f_{\eta}$ be the function defined by (1.8). Then,
(i) For all $y_{1}, \ldots, y_{n} \in \mathbb{R}^{N}, \xi \in \mathbb{R}^{d \times N}$, the limit

$$
\begin{equation*}
\lim _{\eta \rightarrow 0^{+}}\left(\left(f_{\eta}\right)^{* *}\right)^{\infty}\left(y_{1}, \ldots, y_{n}, \xi\right)=:\left(\left(f_{0^{+}}\right)^{* *}\right)^{\infty}\left(y_{1}, \ldots, y_{n}, \xi\right) \tag{2.27}
\end{equation*}
$$

exists, $\left(\left(f_{0^{+}}\right)^{* *}\right)^{\infty}: \mathbb{R}^{n N} \times \mathbb{R}^{d \times N} \rightarrow \mathbb{R}$ is positively 1-homogeneous and convex in the last variable, and $\left(f^{* *}\right)^{\infty} \leqslant\left(\left(f_{0^{+}}\right)^{* *}\right)^{\infty} \leqslant\left(f^{\infty}\right)^{* *}$.
Furthermore, if in addition
a) $f$ also satisfies $(\mathcal{F} 2)$, then $\left(\left(f_{0^{+}}\right)^{* *}\right)^{\infty} \equiv f^{\infty}$;
b) $d=1$ and $f$ also satisfies $(\mathcal{F} 7)$, then $\left(\left(f_{0^{+}}\right)^{* *}\right)^{\infty} \equiv\left(f^{\infty}\right)^{* *}$.
(ii) For all $\xi \in \mathbb{R}^{d \times N}$, the limit

$$
\begin{equation*}
\lim _{\eta \rightarrow 0^{+}}\left(\left(\left(f_{\eta}\right)^{* *}\right)_{\text {hom }}\right)^{\infty}(\xi)=:\left(\left(\left(f_{0^{+}}\right)^{* *}\right)_{\text {hom }}\right)^{\infty}(\xi) \tag{2.28}
\end{equation*}
$$

exists, with $\left(\left(\left(f_{0^{+}}\right)^{* *}\right)_{\text {hom }}\right)^{\infty}: \mathbb{R}^{d \times N} \rightarrow \mathbb{R}$ positively 1-homogeneous, convex, and such that

$$
\left(\left(f^{* *}\right)_{\mathrm{hom}}\right)^{\infty} \leqslant\left(\left(\left(f_{0^{+}}\right)^{* *}\right)_{\mathrm{hom}}\right)^{\infty} \leqslant\left(\left(\left(f_{0^{+}}\right)^{* *}\right)^{\infty}\right)_{\mathrm{hom}} \leqslant\left(\left(f^{\infty}\right)^{* *}\right)_{\mathrm{hom}} .
$$

Furthermore, if in addition
a) $f$ also satisfies $(\mathcal{F} 2)$ and $(\mathcal{F} 8)$, then $\left(\left(\left(f_{0^{+}}\right)^{* *}\right)_{\text {hom }}\right)^{\infty} \equiv\left(f_{\text {hom }}\right)^{\infty}=\left(f^{\infty}\right)_{\text {hom }}$;
b) $f$ also satisfies $(\mathcal{F} 2)$ and $(\mathcal{F} 7)$, then $\left(\left(\left(f_{0^{+}}\right)^{* *}\right)_{\text {hom }}\right)^{\infty} \equiv\left(f^{\infty}\right)_{\text {hom }}$;
c) $d=1$ and $f$ also satisfies $(\mathcal{F} 7)$, then $\left(\left(\left(f_{0^{+}}\right)^{* *}\right)_{\text {hom }}\right)^{\infty} \equiv\left(\left(f^{\infty}\right)^{* *}\right)_{\text {hom }}$.

Proof. Without loss of generality we may assume that the parameter $\eta>0$ takes values on a sequence of positive numbers converging to zero.
(i) We start by observing that for fixed $y_{1}, y_{2} \in \mathbb{R}^{N}, \xi \in \mathbb{R}^{d \times N}$, the sequences $\left\{f_{\eta}\left(y_{1}, y_{2}, \xi\right)\right\}_{\eta>0}$, $\left\{\left(f_{\eta}\right)^{* *}\left(y_{1}, y_{2}, \xi\right)\right\}_{\eta>0}$ and $\left\{\left(\left(f_{\eta}\right)^{* *}\right)^{\infty}\left(y_{1}, y_{2}, \xi\right)\right\}_{\eta>0}$ are decreasing (as $\eta \rightarrow 0^{+}$), so that the respective limits as $\eta \rightarrow 0^{+}$exist and are given by the infimum in $\eta>0$.

Recalling definition (2.5) and in view of $(\mathcal{F} 3)$ and $(\mathcal{F} 4)$, we have that the biconjugate function $f^{* *}$ of $f$ is such that for all $y_{1}, y_{2} \in \mathbb{R}^{N}, f^{* *}\left(y_{1}, y_{2}, \cdot\right)$ is a convex function which coincides with the convex envelop $\mathcal{C} f\left(y_{1}, y_{2}, \cdot\right)$ of $f\left(y_{1}, y_{2}, \cdot\right)$ (see, for example, [37, Thm. 4.92]). Precisely, for all $\left(y_{1}, y_{2}, \xi\right) \in \mathbb{R}^{N} \times \mathbb{R}^{N} \times \mathbb{R}^{d \times N}$,

$$
\begin{equation*}
f^{* *}\left(y_{1}, y_{2}, \xi\right)=\mathcal{C} f\left(y_{1}, y_{2}, \xi\right):=\sup \left\{g(\xi): g: \mathbb{R}^{d \times N} \rightarrow \mathbb{R} \text { convex, } g(\cdot) \leqslant f\left(y_{1}, y_{2}, \cdot\right)\right\} \tag{2.29}
\end{equation*}
$$

Note that the same holds true for $\left(f_{\eta}\right)^{* *}$. Consequently, $\left(\left(f_{\eta}\right)^{* *}\right)^{\infty}$ is a convex function, since the recession function of a convex function is a convex function. Moreover, for all $\eta>0$, we have that

$$
\begin{equation*}
f^{* *} \leqslant\left(f_{\eta}\right)^{* *} \leqslant f_{\eta} \tag{2.30}
\end{equation*}
$$

and so, using the fact that the pointwise limit of a sequence of convex functions is a convex function, passing (2.30) to the limit as $\eta \rightarrow 0^{+}$we get

$$
\begin{equation*}
\lim _{\eta \rightarrow 0^{+}}\left(f_{\eta}\right)^{* *}\left(y_{1}, y_{2}, \xi\right)=f^{* *}\left(y_{1}, y_{2}, \xi\right) \tag{2.31}
\end{equation*}
$$

In view of $(2.30),\left(f^{* *}\right)^{\infty} \leqslant\left(\left(f_{\eta}\right)^{* *}\right)^{\infty} \leqslant\left(f_{\eta}\right)^{\infty}$; thus, letting $\eta \rightarrow 0^{+}$and observing that $\left(f_{\eta}\right)^{\infty}\left(y_{1}, y_{2}, \xi\right)=$ $f^{\infty}\left(y_{1}, y_{2}, \xi\right)+\eta|\xi|$, we have

$$
\begin{equation*}
\left(f^{* *}\right)^{\infty}\left(y_{1}, y_{2}, \xi\right) \leqslant\left(\left(f_{0^{+}}\right)^{* *}\right)^{\infty}\left(y_{1}, y_{2}, \xi\right) \leqslant\left(f^{\infty}\right)^{* *}\left(y_{1}, y_{2}, \xi\right) \tag{2.32}
\end{equation*}
$$

where we also used the fact that both functions $\left(f^{* *}\right)^{\infty}$ and $\left(\left(f_{0^{+}}\right)^{* *}\right)^{\infty}$ are convex in the last variable, since the recession function of a convex function is also a convex function. We further observe that $\left(\left(f_{0^{+}}\right)^{* *}\right)^{\infty}$ is positively 1-homogeneous in the last variable because it is the pointwise limit of a sequence of positively 1-homogeneous functions in the last variable.
(i)-a) If, in addition, $f$ also satisfies $(\mathcal{F} 2)$, then $\left(f^{* *}\right)^{\infty}=f^{\infty}=\left(f^{\infty}\right)^{* *}$, which, together with (2.32), implies that $\left(\left(f_{0^{+}}\right)^{* *}\right)^{\infty} \equiv f^{\infty}$.
(i)-b) Assume that $d=1$ and that, in addition, $f$ also satisfies $(\mathcal{F} 7)$.

In the scalar case $d=1$ the notions of convexity and quasiconvexity agree (see, for example, [24, Thms. 5.3, $6.9]$ ), therefore $f^{* *}$ is alternatively given by

$$
\begin{equation*}
f^{* *}\left(y_{1}, y_{2}, \xi\right)=\inf \left\{\int_{Y} f\left(y_{1}, y_{2}, \xi+\nabla \varphi(y)\right) \mathrm{d} y: \varphi \in W_{0}^{1, \infty}(Y)\right\} \tag{2.33}
\end{equation*}
$$

for $\left(y_{1}, y_{2}, \xi\right) \in \mathbb{R}^{N} \times \mathbb{R}^{N} \times \mathbb{R}^{N}$.

Since $f_{\eta}$ is a Borel function satisfying conditions $(\mathcal{F} 1),(\mathcal{F} 3),(\mathcal{F} 4)^{\prime}$ and $(\mathcal{F} 7)$, using (2.33) and arguing as in the proof of Lemma 2.8, it can be shown that $\left(f_{\eta}\right)^{* *}$ also satisfies $(\mathcal{F} 7)$ and that $\left(\left(f_{\eta}\right)^{* *}\right)^{\infty}=\left(\left(f_{\eta}\right)^{\infty}\right)^{* *}$. Consequently,

$$
\begin{equation*}
\left(\left(f_{0^{+}}\right)^{* *}\right)^{\infty}\left(y_{1}, y_{2}, \xi\right)=\lim _{\eta \rightarrow 0^{+}}\left(\left(f_{\eta}\right)^{* *}\right)^{\infty}\left(y_{1}, y_{2}, \xi\right)=\lim _{\eta \rightarrow 0^{+}}\left(\left(f_{\eta}\right)^{\infty}\right)^{* *}\left(y_{1}, y_{2}, \xi\right)=\left(f^{\infty}\right)^{* *}\left(y_{1}, y_{2}, \xi\right), \tag{2.34}
\end{equation*}
$$

where the last equality may be proved in a similar way as (2.31) (with $f$ replaced by $f^{\infty}$ ).
(ii) Just as (i) above, we can be shown that the limit (2.28) exists and defines a positively 1-homogeneous convex function $\left(\left(\left(f_{0^{+}}\right)^{* *}\right)_{\text {hom }}\right)^{\infty}: \mathbb{R}^{d \times N} \rightarrow \mathbb{R}$.
By (2.6), $(\mathcal{F} 3)$ and $(\mathcal{F} 4)$, there exists a constant $M>0$ such that for all $y_{1}, y_{2} \in \mathbb{R}^{N}, \xi \in \mathbb{R}^{d \times N}$,

$$
\begin{equation*}
\left|f\left(y_{1}, y_{2}, \xi\right)\right| \leqslant M(1+|\xi|), \quad\left|f_{\text {hom }_{2}}\left(y_{1}, \xi\right)\right| \leqslant M(1+|\xi|), \quad\left|f_{\text {hom }}(\xi)\right| \leqslant M(1+|\xi|) \tag{2.35}
\end{equation*}
$$

Using in addition (2.31), Lebesgue Dominated Convergence Theorem yields

$$
\lim _{\eta \rightarrow 0^{+}}\left(\left(f_{\eta}\right)^{* *}\right)_{\text {hom }_{2}}\left(y_{1}, \xi\right) \leqslant\left(f^{* *}\right)_{\text {hom }_{2}}
$$

which, together with inequality $\left(\left(f_{\eta}\right)^{* *}\right)_{\text {hom }_{2}} \geqslant\left(f^{* *}\right)_{\text {hom }_{2}}$, implies that

$$
\lim _{\eta \rightarrow 0^{+}}\left(\left(f_{\eta}\right)^{* *}\right)_{\operatorname{hom}_{2}}\left(y_{1}, \xi\right)=\left(f^{* *}\right)_{\operatorname{hom}_{2}}\left(y_{1}, \xi\right) .
$$

Similar arguments ensure that

$$
\begin{equation*}
\lim _{\eta \rightarrow 0^{+}}\left(\left(f_{\eta}\right)^{* *}\right)_{\text {hom }}(\xi)=\lim _{\eta \rightarrow 0^{+}}\left(\left(\left(f_{\eta}\right)^{* *}\right)_{\text {hom }_{2}}\right)_{\text {hom }_{1}}(\xi)=\left(\left(f^{* *}\right)_{\text {hom }_{2}}\right)_{\text {hom }_{1}}(\xi)=\left(f^{* *}\right)_{\text {hom }}(\xi) \tag{2.36}
\end{equation*}
$$

and that

$$
\begin{equation*}
\lim _{\eta \rightarrow 0^{+}}\left(\left(\left(f_{\eta}\right)^{* *}\right)^{\infty}\right)_{\mathrm{hom}}(\xi)=\left(\left(\left(f_{0^{+}}\right)^{* *}\right)^{\infty}\right)_{\mathrm{hom}}(\xi) \leqslant\left(\left(f^{\infty}\right)^{* *}\right)_{\mathrm{hom}}(\xi) \tag{2.37}
\end{equation*}
$$

with $\left(\left(f_{0^{+}}\right)^{* *}\right)^{\infty}$ the function defined by (2.27), where in the last inequality we used (2.32).
Using the fact that if $g$ is a function satisfying $(\mathcal{F} 3)$ and $(\mathcal{F} 4)$ then $\left(g_{\text {hom }}\right)^{\infty} \leqslant\left(g^{\infty}\right)_{\text {hom }}$, passing to the limit as $\eta \rightarrow 0^{+}$the chain of inequalities

$$
\left(\left(f^{* *}\right)_{\text {hom }}\right)^{\infty} \leqslant\left(\left(\left(f_{\eta}\right)^{* *}\right)_{\text {hom }}\right)^{\infty} \leqslant\left(\left(\left(f_{\eta}\right)^{* *}\right)^{\infty}\right)_{\text {hom }},
$$

from (2.37) we obtain

$$
\begin{equation*}
\left(\left(f^{* *}\right)_{\text {hom }}\right)^{\infty}(\xi) \leqslant\left(\left(\left(f_{0^{+}}\right)^{* *}\right)_{\text {hom }}\right)^{\infty}(\xi) \leqslant\left(\left(\left(f_{0^{+}}\right)^{* *}\right)^{\infty}\right)_{\text {hom }}(\xi) \leqslant\left(\left(f^{\infty}\right)^{* *}\right)_{\text {hom }}(\xi) \tag{2.38}
\end{equation*}
$$

(ii)-a) Assume that, in addition, $f$ also satisfies $(\mathcal{F} 2)$ and $(\mathcal{F} 8)$.

In this case, from (2.38) we get

$$
\begin{equation*}
\left(f_{\text {hom }}\right)^{\infty} \leqslant\left(f_{0^{+}, \text {hom }}\right)^{\infty} \leqslant\left(f^{\infty}\right)_{\text {hom }}, \tag{2.39}
\end{equation*}
$$

where $\left(f_{0^{+}, \text {hom }}\right)^{\infty}:=\left(\left(\left(f_{0^{+}}\right)^{* *}\right)_{\text {hom }}\right)^{\infty}=\lim _{\eta \rightarrow 0^{+}}\left(\left(f_{\eta}\right)_{\text {hom }}\right)^{\infty}(\xi)$, since $\left(f_{\eta}\right)^{* *}=f_{\eta}$. To conclude that $\left(f_{0^{+}, \text {hom }}\right)^{\infty} \equiv\left(f_{\text {hom }}\right)^{\infty}=\left(f^{\infty}\right)_{\text {hom }}$ it suffices to apply Lemma 2.7 to $f$, taking into account (2.39).
(ii)-b) Assume that, in addition, $f$ also satisfies $(\mathcal{F} 2)$ and $(\mathcal{F} 7)$.

As before, using (2.6), equality $\left(f_{\eta}\right)^{\infty}\left(y_{1}, y_{2}, \xi\right)=f^{\infty}\left(y_{1}, y_{2}, \xi\right)+\eta|\xi|$, and Lebesgue Dominated Convergence Theorem together with (2.35), we obtain

$$
\begin{equation*}
\lim _{\eta \rightarrow 0^{+}}\left(\left(f_{\eta}\right)^{\infty}\right)_{\mathrm{hom}}(\xi)=\left(f^{\infty}\right)_{\mathrm{hom}}(\xi) \tag{2.40}
\end{equation*}
$$

By Lemma 2.8 applied to $f_{\eta}$, we conclude that for all $\eta>0,\left(\left(f_{\eta}\right)_{\text {hom }}\right)^{\infty}=\left(\left(f_{\eta}\right)^{\infty}\right)_{\text {hom }}$, which, together with (2.40), yields $\left(f_{0^{+}, \text {hom }}\right)^{\infty} \equiv\left(f^{\infty}\right)_{\text {hom }}$.
(ii)-c) Assume that $d=1$ and that, in addition, $f$ also satisfies $(\mathcal{F} 7)$ (with $d=1$ ).

As we observed in (i)-b), $\left(f_{\eta}\right)^{* *}$ is a Borel function satisfying conditions $(\mathcal{F} 1),(\mathcal{F} 3),(\mathcal{F} 4)^{\prime}$ and $(\mathcal{F} 7)$. Applying Lemma 2.8 to $\left(f_{\eta}\right)^{* *}$, using the first equality in (2.37) and by (2.34),

$$
\begin{aligned}
\left(\left(\left(f_{0^{+}}\right)^{* *}\right)_{\mathrm{hom}}\right)^{\infty}(\xi) & =\lim _{\eta \rightarrow 0^{+}}\left(\left(\left(f_{\eta}\right)^{* *}\right)_{\mathrm{hom}}\right)^{\infty}(\xi)=\lim _{\eta \rightarrow 0^{+}}\left(\left(\left(f_{\eta}\right)^{* *}\right)^{\infty}\right)_{\mathrm{hom}}(\xi) \\
& =\left(\left(\left(f_{0^{+}}\right)^{* *}\right)^{\infty}\right)_{\mathrm{hom}}(\xi)=\left(\left(f^{\infty}\right)^{* *}\right)_{\mathrm{hom}}(\xi)
\end{aligned}
$$

This concludes the proof of Proposition 2.9.
The next lemma will be used within the proof of Theorem 3.1 in Section 3 below.
Lemma 2.10. Let $f: \mathbb{R}^{n N} \times \mathbb{R}^{d \times N} \rightarrow \mathbb{R}$ be a continuous function satisfying hypotheses $(\mathcal{F} 1)$ and ( $\left.\mathcal{F} 2\right)$, and let $K \subset \mathbb{R}^{d \times N}$ be a compact set. Then there exists a positive constant $C(K)$, depending only on $K$, such that for all $y_{1}, y_{2} \in \mathbb{R}^{N}, \xi, \xi^{\prime} \in K$,

$$
\begin{equation*}
\left|f\left(y_{1}, y_{2}, \xi\right)-f\left(y_{1}, y_{2}, \xi^{\prime}\right)\right| \leqslant C(K)\left|\xi-\xi^{\prime}\right| \tag{2.41}
\end{equation*}
$$

Proof. In fact, the continuity of $f$ and $(\mathcal{F} 1)$ ensure that there exists a positive constant $c(K)$ only depending on $K$ such that for all $y_{1}, y_{2} \in \mathbb{R}^{N}, \xi \in K$,

$$
\begin{equation*}
\left|f\left(y_{1}, y_{2}, \xi\right)\right| \leqslant c(K) \tag{2.42}
\end{equation*}
$$

On the other hand, by $(\mathcal{F} 2)$ (see, for example, [37, Thm. 4.36]) $f\left(y_{1}, y_{2}, \cdot\right)$ is locally Lipschitz with

$$
\begin{equation*}
\operatorname{Lip}\left(f\left(y_{1}, y_{2}, \cdot\right) ; B(0 ; r)\right) \leqslant \frac{\sqrt{d \times N}}{r} \sup \left\{\left|f\left(y_{1}, y_{2}, \xi\right)-f\left(y_{1}, y_{2}, \xi^{\prime}\right)\right|: \xi, \xi^{\prime} \in B(0,2 r)\right\} \tag{2.43}
\end{equation*}
$$

From (2.42) and (2.43), we deduce that (2.41) holds.
Finally, we recall that in view of Riemann-Lebesgue's Lemma, if $\varphi \in C\left(\Omega ; C_{\#}\left(Y_{1} \times \cdots \times Y_{n} ; \mathbb{R}^{m}\right)\right)$ then

$$
\begin{equation*}
\varphi\left(\cdot, \frac{\cdot}{\varrho_{1}(\varepsilon)}, \cdots, \frac{\cdot}{\varrho_{n}(\varepsilon)}\right) \stackrel{\star}{\rightharpoonup} \int_{Y_{1} \times \cdots \times Y_{n}} \varphi\left(\cdot, y_{1}, \cdots, y_{n}\right) \mathrm{d} y_{1} \cdots \mathrm{~d} y_{n} \tag{2.44}
\end{equation*}
$$

weakly-丸 in $L_{\text {loc }}^{\infty}\left(\Omega ; \mathbb{R}^{m}\right)$. In particular, if $\varphi \in C_{0}\left(\Omega ; C_{\#}\left(Y_{1} \times \cdots \times Y_{n} ; \mathbb{R}^{m}\right)\right)$ then $(2.44)$ holds weakly-丸 in $L^{\infty}\left(\Omega ; \mathbb{R}^{m}\right)$.
Also, if $a: \mathbb{R}^{n N} \rightarrow \mathbb{R}$ is a $Y_{1} \times \cdots \times Y_{n}$-periodic function such that for some $1 \leqslant p \leqslant \infty$ and for a.e. $y_{n} \in Y_{n}$ we have $a\left(\cdot, y_{n}\right) \in C_{\#}\left(Y_{1} \times \cdots \times Y_{n-1}\right)$ and $\left\|a\left(\cdot, y_{n}\right)\right\|_{C_{\#}\left(Y_{1} \times \cdots \times Y_{n-1}\right)} \in L^{p}\left(Y_{n}\right)$, then (see [32])

$$
\begin{cases}a\left(\frac{\cdot}{\varrho_{1}(\varepsilon)}, \cdots, \frac{\cdot}{\varrho_{n}(\varepsilon)}\right) \rightharpoonup \bar{a} \text { weakly in } L_{\mathrm{loc}}^{p}\left(\mathbb{R}^{N}\right) & \text { if } 1 \leqslant p<\infty  \tag{2.45}\\ a\left(\frac{\dot{\varrho_{1}(\varepsilon)}}{}, \cdots, \frac{\cdot}{\varrho_{n}(\varepsilon)}\right) \stackrel{\rightharpoonup}{a} \text { weakly-ᄎ in } L_{\mathrm{loc}}^{\infty}\left(\mathbb{R}^{N}\right) & \text { if } p=\infty\end{cases}
$$

where $\bar{a}:=\int_{Y_{1} \times \cdots \times Y_{n}} a\left(y_{1}, \cdots, y_{n}\right) \mathrm{d} y_{1} \ldots \mathrm{~d} y_{n}$.

## 3. Proof of Theorem 1.1

Throughout this section we will assume that $n=2$. The cases in which $n=1$ or $n \geqslant 3$ do not bring any additional technical difficulties.

For $n=2$ the energies $F_{\varepsilon}$ in (1.3) take the form

$$
\begin{equation*}
F_{\varepsilon}(u):=\int_{\Omega} f\left(\frac{x}{\varrho_{1}(\varepsilon)}, \frac{x}{\varrho_{2}(\varepsilon)}, \nabla u(x)\right) \mathrm{d} x+\int_{\Omega} f^{\infty}\left(\frac{x}{\varrho_{1}(\varepsilon)}, \frac{x}{\varrho_{2}(\varepsilon)}, \frac{\mathrm{d} D^{s} u}{\mathrm{~d}\left\|D^{s} u\right\|}(x)\right) \mathrm{d}\left\|D^{s} u\right\|(x) \tag{3.1}
\end{equation*}
$$

for $u \in B V\left(\Omega ; \mathbb{R}^{d}\right)$, where, we recall, $\varrho_{1}, \varrho_{2}:(0, \infty) \rightarrow(0, \infty)$ are functions satisfying (1.1) (with $n=2$ ) and $f^{\infty}$ is the recession function associated with $f$. Due to the convexity hypothesis $(\mathcal{F} 2)$, the limit superior defining $f^{\infty}$ is actually a limit (see, for example, [37]), so that $f^{\infty}: \mathbb{R}^{N} \times \mathbb{R}^{N} \times \mathbb{R}^{d \times N} \rightarrow \mathbb{R}$ is given by by

$$
f^{\infty}\left(y_{1}, y_{2}, \xi\right):=\lim _{t \rightarrow \infty} \frac{f\left(y_{1}, y_{2}, t \xi\right)}{t}
$$

Moreover, under hypotheses $(\mathcal{F} 1)-(\mathcal{F} 3)$ and $(\mathcal{F} 4)^{\star}$ on $f$, we have that $f^{\infty}$ is a Borel function satisfying $(\mathcal{F} 1)$, $(\mathcal{F} 2)$, and the growth condition

$$
\begin{equation*}
0 \leqslant f^{\infty}\left(y_{1}, y_{2}, \xi\right) \leqslant C|\xi| \tag{3.2}
\end{equation*}
$$

Notice that in view of $(\mathcal{F} 3),(\mathcal{F} 4)^{\star}$ and (3.2), the functional $F_{\varepsilon}$ is well defined (in $\left.\mathbb{R}\right)$ for every $u \in B V\left(\Omega ; \mathbb{R}^{d}\right)$.
In Theorem 3.1 below we will establish (1.6). We will use the unfolding operator (see [20], [22]; see also [36]): For $\varrho>0, \mathcal{T}_{\varrho}: L^{1}\left(\Omega ; \mathbb{R}^{m}\right) \rightarrow L^{1}\left(\mathbb{R}^{N} ; L_{\#}^{1}\left(Y_{2} ; \mathbb{R}^{m}\right)\right)$ is defined by

$$
\mathcal{T}_{\varrho}(g)\left(x, y_{2}\right):=\tilde{g}\left(\varrho\left[\frac{x}{\varrho}\right]+\varrho\left(y_{2}-\left[y_{2}\right]\right)\right) \text { for } x, y_{2} \in \mathbb{R}^{N}, g \in L^{1}\left(\Omega ; \mathbb{R}^{m}\right)
$$

where $\tilde{g}$ is the extension by zero of $g$ to $\mathbb{R}^{N}$. Clearly $\mathcal{T}_{\varrho}$ is linear, and for every $g \in L^{1}\left(\Omega ; \mathbb{R}^{m}\right)$

$$
\begin{equation*}
\left\|\mathcal{T}_{\varrho}(g)\right\|_{L^{1}\left(\Omega \times Y_{2} ; \mathbb{R}^{m}\right)} \leqslant\left\|\mathcal{T}_{\varrho}(g)\right\|_{L^{1}\left(\mathbb{R}^{N} \times Y_{2} ; \mathbb{R}^{m}\right)}=\|\tilde{g}\|_{L^{1}\left(\mathbb{R}^{N} ; \mathbb{R}^{m}\right)}=\|g\|_{L^{1}\left(\Omega ; \mathbb{R}^{m}\right)} \tag{3.3}
\end{equation*}
$$

and

$$
\begin{equation*}
\lim _{\varrho \rightarrow 0^{+}} \int_{\mathbb{R}^{N} \times Y_{2}}\left|\tilde{g}(x)-\mathcal{T}_{\varrho}(g)\left(x, y_{2}\right)\right| \mathrm{d} x \mathrm{~d} y_{2}=0 \tag{3.4}
\end{equation*}
$$

(see [36, Prop. A.1]).
Similarly, we define the operator $\mathcal{A}_{\varrho}: L^{1}\left(\Omega \times Y_{2} ; \mathbb{R}^{m}\right) \rightarrow L^{1}\left(\mathbb{R}^{N} ; L_{\#}^{1}\left(Y_{1} ; L^{1}\left(Y_{2} ; \mathbb{R}^{m}\right)\right)\right)$ by

$$
\begin{aligned}
& \mathcal{A}_{\varrho}(h)\left(x, y_{1}, y_{2}\right) \\
& \quad:=\tilde{h}\left(\varrho\left[\frac{x}{\varrho}\right]+\varrho\left(y_{1}-\left[y_{1}\right]\right), y_{2}\right)=\mathcal{T}_{\varrho}\left(h\left(\cdot, y_{2}\right)\right)\left(x, y_{1}\right) \quad \text { for } x, y_{1} \in \mathbb{R}^{N}, y_{2} \in Y_{2}, h \in L^{1}\left(\Omega \times Y_{2} ; \mathbb{R}^{m}\right),
\end{aligned}
$$

where $\tilde{h}$ is the extension by zero of $h$ to $\mathbb{R}^{N} \times Y_{2}$. $\mathcal{A}_{\varrho}$ is linear, and for all $h \in L^{1}\left(\Omega \times Y_{2} ; \mathbb{R}^{m}\right)$,

$$
\begin{equation*}
\left\|\mathcal{A}_{\varrho}(h)\right\|_{L^{1}\left(\Omega \times Y_{1} \times Y_{2} ; \mathbb{R}^{m}\right)} \leqslant\left\|\mathcal{A}_{\varrho}(h)\right\|_{L^{1}\left(\mathbb{R}^{N} \times Y_{1} \times Y_{2} ; \mathbb{R}^{m}\right)}=\|\tilde{h}\|_{L^{1}\left(\mathbb{R}^{N} \times Y_{2} ; \mathbb{R}^{m}\right)}=\|h\|_{L^{1}\left(\Omega \times Y_{2} ; \mathbb{R}^{m}\right)} \tag{3.5}
\end{equation*}
$$

by (3.3) and Fubini's Theorem. Moreover, we notice that for a.e. $y_{2} \in Y_{2}$, we have

$$
\lim _{\varrho \rightarrow 0^{+}} \int_{\mathbb{R}^{N} \times Y_{1}}\left|\tilde{h}\left(x, y_{2}\right)-\mathcal{T}_{\varrho}\left(h\left(\cdot, y_{2}\right)\right)\left(x, y_{1}\right)\right| \mathrm{d} x \mathrm{~d} y_{1}=0
$$

by (3.4), and

$$
\int_{\mathbb{R}^{N} \times Y_{1}}\left|\tilde{h}\left(x, y_{2}\right)-\mathcal{T}_{\varrho}\left(h\left(\cdot, y_{2}\right)\right)\left(x, y_{1}\right)\right| \mathrm{d} x \mathrm{~d} y_{1} \leqslant 2 \int_{\mathbb{R}^{N}}\left|\tilde{h}\left(x, y_{2}\right)\right| \mathrm{d} x \in L^{1}\left(Y_{2}\right)
$$

where we used (3.3) to obtain

$$
\int_{\mathbb{R}^{N} \times Y_{1}}\left|\mathcal{T}_{\varrho}\left(h\left(\cdot, y_{2}\right)\right)\left(x, y_{1}\right)\right| \mathrm{d} x \mathrm{~d} y_{1}=\int_{\mathbb{R}^{N}}\left|\tilde{h}\left(x, y_{2}\right)\right| \mathrm{d} x .
$$

Thus, Lebesgue Dominated Convergence Theorem yields

$$
\begin{aligned}
& \lim _{\varrho \rightarrow 0^{+}} \int_{\mathbb{R}^{N} \times Y_{1} \times Y_{2}}\left|\tilde{h}\left(x, y_{2}\right)-\mathcal{A}_{\varrho}(h)\left(x, y_{1}, y_{2}\right)\right| \mathrm{d} x \mathrm{~d} y_{1} \mathrm{~d} y_{2} \\
& \quad=\lim _{\varrho \rightarrow 0^{+}} \int_{\mathbb{R}^{N} \times Y_{1} \times Y_{2}}\left|\tilde{h}\left(x, y_{2}\right)-\mathcal{T}_{\varrho}\left(h\left(\cdot, y_{2}\right)\right)\left(x, y_{1}\right)\right| \mathrm{d} x \mathrm{~d} y_{1} \mathrm{~d} y_{2}=0 .
\end{aligned}
$$

Theorem 3.1. Let $\Omega \subset \mathbb{R}^{N}$ be an open, bounded set with $\partial \Omega$ Lipschitz, let $Y_{1}=Y_{2}:=(0,1)^{N}$, and let $f: \mathbb{R}^{N} \times \mathbb{R}^{N} \times \mathbb{R}^{d \times N} \rightarrow \mathbb{R}$ be a Borel function satisfying conditions $(\mathcal{F} 1)-(\mathcal{F} 3),(\mathcal{F} 4)^{\star},(\mathcal{F} 5),(\mathcal{F} 6)$ for $n=2$. Then (1.6) holds (with $n=2$ ).

The proof of Theorem 3.1 is hinged on some lemmas. The first lemma "unfolds" the rapidly oscillating sequence.

Lemma 3.2. Under the same hypotheses of Theorem 3.1, if $\left\{v_{\varepsilon}\right\}_{\varepsilon>0} \subset L^{1}\left(\Omega ; \mathbb{R}^{d \times N}\right)$ is a bounded sequence then, for all $\eta>0$,

$$
\begin{equation*}
\liminf _{\varepsilon \rightarrow 0^{+}} \int_{\Omega} f_{\eta}\left(\frac{x}{\varrho_{1}(\varepsilon)}, \frac{x}{\varrho_{2}(\varepsilon)}, v_{\varepsilon}(x)\right) \mathrm{d} x \geqslant \liminf _{\varepsilon \rightarrow 0^{+}} \int_{\Omega \times Y_{1} \times Y_{2}} f_{\eta}\left(y_{1}, y_{2}, \mathcal{A}_{\varrho_{1}(\varepsilon)}\left(\mathcal{T}_{\varrho_{2}(\varepsilon)}\left(v_{\varepsilon}\right)\right)\left(x, y_{1}, y_{2}\right)\right) \mathrm{d} x \mathrm{~d} y_{1} \mathrm{~d} y_{2} \tag{3.6}
\end{equation*}
$$

where $f_{\eta}\left(y_{1}, y_{2}, \xi\right):=f\left(y_{1}, y_{2}, \xi\right)+\eta|\xi|$.
Proof. Fix $\eta>0$ and $\delta>0$. Let $b_{\eta} \in \mathbb{R}$ be given by $(\mathcal{F} 4)^{\star}$ (see Remark 1.3), and let $\tilde{a}_{\delta} \in L_{\#}^{1}\left(Y_{1} \times Y_{2}\right)$ and $\tau_{\delta}>0$ be given by $(\mathcal{F} 6)$. Then

$$
\begin{equation*}
f_{\eta}(\cdot, \cdot, \cdot) \geqslant-b_{\eta}, \tag{3.7}
\end{equation*}
$$

and, for all $y_{1}, y_{1}^{\prime}, y_{2} \in \mathbb{R}^{N}, \xi \in \mathbb{R}^{d \times N}$ such that $\left|y_{1}-y_{1}^{\prime}\right| \leqslant \tau_{\delta}$,

$$
\begin{equation*}
f_{\eta}\left(y_{1}, y_{2}, \xi\right) \geqslant \delta \tilde{a}_{\delta}\left(y_{1}^{\prime}, y_{2}\right)+(1+o(1)) f_{\eta}\left(y_{1}^{\prime}, y_{2}, \xi\right)-o(1) \eta|\xi| \quad\left(\text { as } \delta \rightarrow 0^{+}\right) . \tag{3.8}
\end{equation*}
$$

Set $c:=\sup _{\varepsilon}\left\|v_{\varepsilon}\right\|_{L^{1}\left(\Omega ; \mathbb{R}^{d \times N}\right)}, \varepsilon_{1}:=\varrho_{1}(\varepsilon)$ and $\varepsilon_{2}:=\varrho_{2}(\varepsilon)$. Define

$$
\begin{equation*}
Z_{\varepsilon_{2}}:=\left\{\kappa \in \mathbb{Z}^{N}: \varepsilon_{2}\left(\kappa+Y_{2}\right) \cap \bar{\Omega} \neq \emptyset\right\}, \quad \Omega_{\varepsilon_{2}}:=\operatorname{int}\left(\bigcup_{\kappa \in Z_{\varepsilon_{2}}} \varepsilon_{2}\left(\kappa+\bar{Y}_{2}\right)\right) \tag{3.9}
\end{equation*}
$$

Notice that $\Omega \subset \Omega_{\varepsilon_{2}}$ and, by (3.3),

$$
\begin{equation*}
\sup _{\varepsilon>0}\left\|\mathcal{T}_{\varepsilon_{2}}\left(v_{\varepsilon}\right)\right\|_{L^{1}\left(\mathbb{R}^{N} \times Y_{2} ; \mathbb{R}^{d \times N}\right)} \leqslant c . \tag{3.10}
\end{equation*}
$$

Recalling that $\tilde{v}_{\varepsilon}$ stands for the extension by zero to the whole $\mathbb{R}^{N}$ of $v_{\varepsilon}$, using $(\mathcal{F} 3)$, a change of variables and $(\mathcal{F} 1)$, in this order, we obtain

$$
\begin{align*}
\int_{\Omega} f_{\eta}\left(\frac{x}{\varepsilon_{1}}, \frac{x}{\varepsilon_{2}}, v_{\varepsilon}(x)\right) \mathrm{d} x & =\int_{\Omega_{\varepsilon_{2}}} f_{\eta}\left(\frac{x}{\varepsilon_{1}}, \frac{x}{\varepsilon_{2}}, \tilde{v}_{\varepsilon}(x)\right) \mathrm{d} x-\int_{\Omega_{\varepsilon_{2}} \backslash \Omega} f_{\eta}\left(\frac{x}{\varepsilon_{1}}, \frac{x}{\varepsilon_{2}}, 0\right) \mathrm{d} x \\
& \geqslant \sum_{\kappa \in Z_{\varepsilon_{2}}} \int_{\varepsilon_{2}\left(\kappa+Y_{2}\right)} f_{\eta}\left(\frac{x}{\varepsilon_{1}}, \frac{x}{\varepsilon_{2}}, \tilde{v}_{\varepsilon}(x)\right) \mathrm{d} x-C \mathcal{L}^{N}\left(\Omega_{\varepsilon_{2}} \backslash \Omega\right)  \tag{3.11}\\
& =\sum_{\kappa \in Z_{\varepsilon_{2}}} \int_{Y_{2}} f_{\eta}\left(\frac{\varepsilon_{2}}{\varepsilon_{1}} \kappa+\frac{\varepsilon_{2}}{\varepsilon_{1}} y_{2}, y_{2}, \tilde{v}_{\varepsilon}\left(\varepsilon_{2} \kappa+\varepsilon_{2} y_{2}\right)\right) \varepsilon_{2}^{N} \mathrm{~d} y_{2}-C \mathcal{L}^{N}\left(\Omega_{\varepsilon_{2}} \backslash \Omega\right) .
\end{align*}
$$

Since $\left[\frac{x}{\varepsilon_{2}}\right]=\kappa$ whenever $x \in \varepsilon_{2}\left(\kappa+Y_{2}\right), \mathcal{L}^{N}\left(\varepsilon_{2}\left(\kappa+Y_{2}\right)\right)=\varepsilon_{2}^{N}$ and $\left[y_{2}\right]=0$ for all $y_{2} \in Y_{2}$, in view of the definition of $\mathcal{T}_{\varepsilon_{2}}\left(v_{\varepsilon}\right)$, by Fubini's Theorem, and from (3.11) we get

$$
\begin{align*}
& \int_{\Omega} f_{\eta}\left(\frac{x}{\varepsilon_{1}}, \frac{x}{\varepsilon_{2}}, v_{\varepsilon}(x)\right) \mathrm{d} x \\
& \quad \geqslant \sum_{\kappa \in Z_{\varepsilon_{2}}} \int_{\varepsilon_{2}\left(\kappa+Y_{2}\right)}\left(\int_{Y_{2}} f_{\eta}\left(\frac{\varepsilon_{2}}{\varepsilon_{1}}\left[\frac{x}{\varepsilon_{2}}\right]+\frac{\varepsilon_{2}}{\varepsilon_{1}} y_{2}, y_{2}, \tilde{v}_{\varepsilon}\left(\varepsilon_{2}\left[\frac{x}{\varepsilon_{2}}\right]+\varepsilon_{2} y_{2}\right)\right) \mathrm{d} y_{2}\right) \mathrm{d} x-C \mathcal{L}^{N}\left(\Omega_{\varepsilon_{2}} \backslash \Omega\right)  \tag{3.12}\\
& \quad=\int_{\Omega_{\varepsilon_{2}} \times Y_{2}} f_{\eta}\left(\frac{\varepsilon_{2}}{\varepsilon_{1}}\left[\frac{x}{\varepsilon_{2}}\right]+\frac{\varepsilon_{2}}{\varepsilon_{1}} y_{2}, y_{2}, \mathcal{T}_{\varepsilon_{2}}\left(v_{\varepsilon}\right)\left(x, y_{2}\right)\right) \mathrm{d} x \mathrm{~d} y_{2}-C \mathcal{L}^{N}\left(\Omega_{\varepsilon_{2}} \backslash \Omega\right) \\
& \quad \geqslant \int_{\Omega \times Y_{2}} f_{\eta}\left(\frac{\varepsilon_{2}}{\varepsilon_{1}}\left[\frac{x}{\varepsilon_{2}}\right]+\frac{\varepsilon_{2}}{\varepsilon_{1}} y_{2}, y_{2}, \mathcal{T}_{\varepsilon_{2}}\left(v_{\varepsilon}\right)\left(x, y_{2}\right)\right) \mathrm{d} x \mathrm{~d} y_{2}-\left(b_{\eta}+C\right) \mathcal{L}^{N}\left(\Omega_{\varepsilon_{2}} \backslash \Omega\right),
\end{align*}
$$

where in the last inequality we used (3.7).
By (1.1) there exists $\varepsilon_{\delta}>0$ such that for all $0<\varepsilon \leqslant \varepsilon_{\delta}$ one has $0<\varepsilon_{2} / \varepsilon_{1}<\tau_{\delta} / 2 \sqrt{N}$. For any such $\varepsilon$,

$$
\sup _{x \in \Omega, y_{2} \in Y_{2}}\left|\frac{\varepsilon_{2}}{\varepsilon_{1}}\left[\frac{x}{\varepsilon_{2}}\right]+\frac{\varepsilon_{2}}{\varepsilon_{1}} y_{2}-\frac{x}{\varepsilon_{1}}\right|=\sup _{x \in \Omega, y_{2} \in Y_{2}}\left|-\frac{\varepsilon_{2}}{\varepsilon_{1}}\left\langle\frac{x}{\varepsilon_{2}}\right\rangle+\frac{\varepsilon_{2}}{\varepsilon_{1}} y_{2}\right|<\tau_{\delta}
$$

thus (3.8) and (3.10) yield

$$
\begin{align*}
& \int_{\Omega \times Y_{2}} f_{\eta}\left(\frac{\varepsilon_{2}}{\varepsilon_{1}}\left[\frac{x}{\varepsilon_{2}}\right]+\frac{\varepsilon_{2}}{\varepsilon_{1}} y_{2}, y_{2}, \mathcal{T}_{\varepsilon_{2}}\left(v_{\varepsilon}\right)\left(x, y_{2}\right)\right) \mathrm{d} x \mathrm{~d} y_{2}  \tag{3.13}\\
& \quad \geqslant \delta \int_{\Omega \times Y_{2}} \tilde{a}_{\delta}\left(\frac{x}{\varepsilon_{1}}, y_{2}\right) \mathrm{d} x \mathrm{~d} y_{2}+(1+o(1)) \int_{\Omega \times Y_{2}} f_{\eta}\left(\frac{x}{\varepsilon_{1}}, y_{2}, \mathcal{T}_{\varepsilon_{2}}\left(v_{\varepsilon}\right)\left(x, y_{2}\right)\right) \mathrm{d} x \mathrm{~d} y_{2}-|o(1)| \eta c .
\end{align*}
$$

Defining $Z_{\varepsilon_{1}}$ and $\Omega_{\varepsilon_{1}}$ as in (3.9) (with $\varepsilon_{2}$ and $Y_{2}$ replaced by $\varepsilon_{1}$ and $Y_{1}$, respectively), and reasoning as in (3.11)-(3.12), we conclude that

$$
\begin{align*}
& \int_{\Omega \times Y_{2}} f_{\eta}\left(\frac{x}{\varepsilon_{1}}, y_{2}, \mathcal{T}_{\varepsilon_{2}}\left(v_{\varepsilon}\right)\left(x, y_{2}\right)\right) \mathrm{d} x \mathrm{~d} y_{2} \\
& \quad \geqslant \int_{\Omega \times Y_{1} \times Y_{2}} f_{\eta}\left(y_{1}, y_{2}, \mathcal{A}_{\varepsilon_{1}}\left(\mathcal{T}_{\varepsilon_{2}}\left(v_{\varepsilon}\right)\right)\left(x, y_{1}, y_{2}\right)\right) \mathrm{d} x \mathrm{~d} y_{1} \mathrm{~d} y_{2}-\left(b_{\eta}+C\right) \mathcal{L}^{N}\left(\Omega_{\varepsilon_{1}} \backslash \Omega\right) \tag{3.14}
\end{align*}
$$

By the Riemann-Lebesgue Lemma we have that for a.e. $y_{2} \in Y_{2}, \tilde{a}_{\delta}\left(\cdot / \varepsilon_{1}, y_{2}\right) \rightharpoonup \int_{Y_{1}} \tilde{a}_{\delta}\left(y_{1}, y_{2}\right) \mathrm{d} y_{1}$ weakly in $L_{\text {loc }}^{1}\left(\mathbb{R}^{N}\right)$. Hence,

$$
\begin{equation*}
\liminf _{\varepsilon \rightarrow 0^{+}} \int_{\Omega \times Y_{2}} \tilde{a}_{\delta}\left(\frac{x}{\varepsilon_{1}}, y_{2}\right) \mathrm{d} x \mathrm{~d} y_{2} \geqslant \mathcal{L}^{N}(\Omega) \int_{Y_{1} \times Y_{2}} \tilde{a}_{\delta}\left(y_{1}, y_{2}\right) \mathrm{d} y_{1} \mathrm{~d} y_{2}, \tag{3.15}
\end{equation*}
$$

where we have also used Fatou's Lemma and Fubini's Theorem.
In view of (3.12)-(3.15), we obtain

$$
\begin{align*}
& \liminf _{\varepsilon \rightarrow 0^{+}} \int_{\Omega} f_{\eta}\left(\frac{x}{\varepsilon_{1}}, \frac{x}{\varepsilon_{2}}, v_{\varepsilon}(x)\right) \mathrm{d} x \\
& \geqslant(1+o(1)) \liminf _{\varepsilon \rightarrow 0^{+}} \int_{\Omega \times Y_{1} \times Y_{2}} f_{\eta}\left(y_{1}, y_{2}, \mathcal{A}_{\varepsilon_{1}}\left(\mathcal{T}_{\varepsilon_{2}}\left(v_{\varepsilon}\right)\right)\left(x, y_{1}, y_{2}\right)\right) \mathrm{d} x \mathrm{~d} y_{1} \mathrm{~d} y_{2}  \tag{3.16}\\
& \quad+\delta \mathcal{L}^{N}(\Omega) \int_{Y_{1} \times Y_{2}} \tilde{a}_{\delta}\left(y_{1}, y_{2}\right) \mathrm{d} y_{1} \mathrm{~d} y_{2}-|o(1)| \eta c
\end{align*}
$$

where we also used the convergences $\mathcal{L}^{N}\left(\Omega_{\varepsilon_{1}} \backslash \Omega\right), \mathcal{L}^{N}\left(\Omega_{\varepsilon_{2}} \backslash \Omega\right) \rightarrow 0$ as $\varepsilon \rightarrow 0^{+}$, since $\partial \Omega$ is Lipschitz and so $\mathcal{L}^{N}(\partial \Omega)=0$. Finally, recalling that $\delta\left\|\tilde{a}_{\delta}\right\|_{L_{\#}^{1}\left(Y_{1} \times Y_{2}\right)} \rightarrow 0$ as $\delta \rightarrow 0^{+}$, passing (3.16) to the limit as $\delta \rightarrow 0^{+}$ we get (3.6).

Remark 3.3. The previous proof can be easily generalized to the case in which $n \geqslant 3$ by using (2.45) in place of Riemann-Lebesgue Lemma (see (3.15)).

We now show that, similarly to what happens in the $L^{p}$-case with $p \in(1, \infty)$ (see [22, Prop. 2.14]), 3scale convergence of a sequence of measures absolutely continuous with respect to the Lebesgue measure is equivalent to a weak- convergence in the sense of measures in a product space of the unfolded sequence.

Lemma 3.4. Let $\Omega \subset \mathbb{R}^{N}$ be open and bounded, let $\left\{v_{\varepsilon}\right\}_{\varepsilon>0} \subset L^{1}\left(\Omega ; \mathbb{R}^{d \times N}\right)$ be a bounded sequence and let $\lambda \in \mathcal{M}_{y \#}\left(\Omega \times Y_{1} \times Y_{2} ; \mathbb{R}^{d \times N}\right)$. Then $v_{\varepsilon} \mathcal{L}^{N}{ }_{\lfloor\Omega} \frac{3-s c}{\varepsilon} \lambda$ if, and only if, $\mathcal{A}_{\varrho_{1}(\varepsilon)}\left(\mathcal{T}_{\varrho_{2}(\varepsilon)}\left(v_{\varepsilon}\right)\right) \mathcal{L}^{3 N}{ }_{\left\lfloor\Omega \times Y_{1} \times Y_{2}\right.} \stackrel{\star}{\rightharpoonup} \lambda$ weakly-ᄎ in $\mathcal{M}_{y \#}\left(\Omega \times Y_{1} \times Y_{2} ; \mathbb{R}^{d \times N}\right)$ as $\varepsilon \rightarrow 0^{+}$.
Proof. For $\delta>0$, define the sets

$$
W_{\delta}:=\left\{\kappa \in \mathbb{Z}^{N}: \delta(\kappa+Y) \subset \Omega\right\}, \quad \Omega_{\delta}:=\operatorname{int}\left(\bigcup_{\kappa \in W_{\delta}} \delta(\kappa+\bar{Y})\right)
$$

Take $\phi \in C_{c}^{1}(\Omega), \psi_{1} \in C_{\#}^{1}\left(Y_{1}\right)$ and $\psi_{2} \in C_{\#}^{1}\left(Y_{2} ; \mathbb{R}^{d \times N}\right)$, and let $\varphi:=\phi \psi_{1} \psi_{2}$. Set $\varepsilon_{1}:=\varrho_{1}(\varepsilon)$ and $\varepsilon_{2}:=\varrho_{2}(\varepsilon)$. By (1.1) we can find $\bar{\varepsilon}>0$ such that for all $0<\varepsilon \leqslant \bar{\varepsilon}$ one has

$$
\begin{equation*}
\operatorname{dist}\left(\operatorname{supp} \phi, \Omega \backslash \Omega_{\varepsilon_{1}}\right)>2 \varepsilon_{1} \sqrt{N}, \quad \operatorname{dist}\left(\operatorname{supp} \phi, \Omega \backslash \Omega_{\varepsilon_{2}}\right)>2 \varepsilon_{1} \sqrt{N} \tag{3.17}
\end{equation*}
$$

Fix any such $\varepsilon$. Using (3.17), the definition of $\mathcal{A}_{\varepsilon_{1}}$, Fubini's Theorem, and the equalities $\left[\frac{x}{\varepsilon_{1}}\right]=\kappa$ if $x \in \varepsilon_{1}\left(\kappa+Y_{1}\right)$ and $\left[y_{1}\right]=0$ if $y_{1} \in Y_{1}$, in this order, we get

$$
\begin{align*}
& \int_{\Omega \times Y_{1} \times Y_{2}} \varphi\left(x, y_{1}, y_{2}\right): \mathcal{A}_{\varepsilon_{1}}\left(\mathcal{T}_{\varepsilon_{2}}\left(v_{\varepsilon}\right)\right)\left(x, y_{1}, y_{2}\right) \mathrm{d} x \mathrm{~d} y_{1} \mathrm{~d} y_{2} \\
& \quad=\int_{\Omega_{\varepsilon_{1}} \times Y_{1} \times Y_{2}} \varphi\left(x, y_{1}, y_{2}\right): \mathcal{T}_{\varepsilon_{2}}\left(v_{\varepsilon}\right)\left(\varepsilon_{1}\left[\frac{x}{\varepsilon_{1}}\right]+\varepsilon_{1}\left(y_{1}-\left[y_{1}\right]\right), y_{2}\right) \mathrm{d} x \mathrm{~d} y_{1} \mathrm{~d} y_{2}  \tag{3.18}\\
& =\int_{Y_{1} \times Y_{2}}\left(\sum_{\kappa \in W_{\varepsilon_{1}}} \int_{\varepsilon_{1}\left(\kappa+Y_{1}\right)} \varphi\left(x, y_{1}, y_{2}\right): \mathcal{T}_{\varepsilon_{2}}\left(v_{\varepsilon}\right)\left(\varepsilon_{1} \kappa+\varepsilon_{1} y_{1}, y_{2}\right) \mathrm{d} x\right) \mathrm{d} y_{1} \mathrm{~d} y_{2}
\end{align*}
$$

Performing the change of variables $x=\varepsilon_{1} \kappa+\varepsilon_{1} \zeta$, by Fubini's Theorem the last integral in (3.18) becomes

$$
\begin{equation*}
\int_{Y_{1} \times Y_{2}}\left(\sum_{\kappa \in W_{\varepsilon_{1}}} \int_{Y_{1}} \varphi\left(\varepsilon_{1} \kappa+\varepsilon_{1} \zeta, y_{1}, y_{2}\right): \mathcal{T}_{\varepsilon_{2}}\left(v_{\varepsilon}\right)\left(\varepsilon_{1} \kappa+\varepsilon_{1} y_{1}, y_{2}\right) \varepsilon_{1}^{N} \mathrm{~d} y_{1}\right) \mathrm{d} \zeta \mathrm{~d} y_{2} \tag{3.19}
\end{equation*}
$$

Considering now the change of variables $y_{1}=\frac{x}{\varepsilon_{1}}-\kappa$, and using again Fubini's Theorem, (3.19) reduces to

$$
\begin{align*}
& \int_{Y_{1} \times Y_{2}}\left(\sum_{\kappa \in W_{\varepsilon_{1}}} \int_{\varepsilon_{1}\left(\kappa+Y_{1}\right)} \varphi\left(\varepsilon_{1} \kappa+\varepsilon_{1} \zeta, \frac{x}{\varepsilon_{1}}-\kappa, y_{2}\right): \mathcal{T}_{\varepsilon_{2}}\left(v_{\varepsilon}\right)\left(x, y_{2}\right) \mathrm{d} x\right) \mathrm{d} \zeta \mathrm{~d} y_{2} \\
& \quad=\int_{Y_{1} \times Y_{2}}\left(\int_{\Omega_{\varepsilon_{1}}} \varphi\left(\varepsilon_{1}\left[\frac{x}{\varepsilon_{1}}\right]+\varepsilon_{1} \zeta, \frac{x}{\varepsilon_{1}}, y_{2}\right): \mathcal{T}_{\varepsilon_{2}}\left(v_{\varepsilon}\right)\left(x, y_{2}\right) \mathrm{d} x\right) \mathrm{d} \zeta \mathrm{~d} y_{2}  \tag{3.20}\\
& \quad=\int_{\Omega_{\varepsilon_{1} \times Y_{1} \times Y_{2}}} \varphi\left(\varepsilon_{1}\left[\frac{x}{\varepsilon_{1}}\right]+\varepsilon_{1} y_{1}, \frac{x}{\varepsilon_{1}}, y_{2}\right): \mathcal{T}_{\varepsilon_{2}}\left(v_{\varepsilon}\right)\left(x, y_{2}\right) \mathrm{d} x \mathrm{~d} y_{1} \mathrm{~d} y_{2}
\end{align*}
$$

where in the first equality we used the $Y_{1}$-periodicity of $\psi_{1}$.
We claim that if $x \in \Omega \backslash \Omega_{\varepsilon_{1}} \cup \Omega \backslash \Omega_{\varepsilon_{2}}$ then

$$
\begin{equation*}
\left(\varepsilon_{1}\left[\frac{x}{\varepsilon_{1}}\right]+\varepsilon_{1} Y_{1}\right) \cap \operatorname{supp} \phi=\emptyset \tag{3.21}
\end{equation*}
$$

In fact, if there was $z \in\left(\varepsilon_{1}\left[\frac{x}{\varepsilon_{1}}\right]+\varepsilon_{1} Y_{1}\right) \cap \operatorname{supp} \phi$, then $z=\varepsilon_{1}\left[\frac{x}{\varepsilon_{1}}\right]+\varepsilon_{1} y_{1}$ for some $y_{1} \in Y_{1}$ and, by (3.17),

$$
2 \varepsilon_{1} \sqrt{N}<\operatorname{dist}(\operatorname{supp} \phi, x) \leqslant|z-x|=\left|\varepsilon_{1}\left[\frac{x}{\varepsilon_{1}}\right]+\varepsilon_{1} y_{1}-x\right|=\left|-\varepsilon_{1}\left\langle\frac{x}{\varepsilon_{1}}\right\rangle+\varepsilon_{1} y_{1}\right| \leqslant 2 \varepsilon_{1} \sqrt{N},
$$

which is a contradiction. Hence, (3.21) holds. Consequently,

$$
\begin{align*}
& \int_{\Omega_{\varepsilon_{1}} \times Y_{1} \times Y_{2}} \varphi\left(\varepsilon_{1}\left[\frac{x}{\varepsilon_{1}}\right]+\varepsilon_{1} y_{1}, \frac{x}{\varepsilon_{1}}, y_{2}\right): \mathcal{T}_{\varepsilon_{2}}\left(v_{\varepsilon}\right)\left(x, y_{2}\right) \mathrm{d} x \mathrm{~d} y_{1} \mathrm{~d} y_{2} \\
& \quad=\int_{\Omega_{\varepsilon_{2}} \times Y_{1} \times Y_{2}} \varphi\left(\varepsilon_{1}\left[\frac{x}{\varepsilon_{1}}\right]+\varepsilon_{1} y_{1}, \frac{x}{\varepsilon_{1}}, y_{2}\right): \mathcal{T}_{\varepsilon_{2}}\left(v_{\varepsilon}\right)\left(x, y_{2}\right) \mathrm{d} x \mathrm{~d} y_{1} \mathrm{~d} y_{2} \tag{3.22}
\end{align*}
$$

Arguing as in (3.18)-(3.20), we have

$$
\begin{align*}
& \int_{\Omega_{\varepsilon_{2} \times Y_{1} \times Y_{2}}} \varphi\left(\varepsilon_{1}\left[\frac{x}{\varepsilon_{1}}\right]+\varepsilon_{1} y_{1}, \frac{x}{\varepsilon_{1}}, y_{2}\right): \mathcal{T}_{\varepsilon_{2}}\left(v_{\varepsilon}\right)\left(x, y_{2}\right) \mathrm{d} x \mathrm{~d} y_{1} \mathrm{~d} y_{2} \\
& \quad=\int_{Y_{1} \times Y_{2}}\left(\sum_{\kappa \in W_{\varepsilon_{2}}} \int_{\varepsilon_{2}\left(\kappa+Y_{2}\right)} \varphi\left(\varepsilon_{1}\left[\frac{x}{\varepsilon_{1}}\right]+\varepsilon_{1} y_{1}, \frac{x}{\varepsilon_{1}}, y_{2}\right): v_{\varepsilon}\left(\varepsilon_{2} \kappa+\varepsilon_{2} y_{2}\right) \mathrm{d} x\right) \mathrm{d} y_{1} \mathrm{~d} y_{2} \\
& \quad=\int_{Y_{1} \times Y_{2}}\left(\sum_{\kappa \in W_{\varepsilon_{2}}} \int_{Y_{2}} \varphi\left(\varepsilon_{1}\left[\frac{\varepsilon_{2}}{\varepsilon_{1}} \kappa+\frac{\varepsilon_{2}}{\varepsilon_{1}} \zeta\right]+\varepsilon_{1} y_{1}, \frac{\varepsilon_{2}}{\varepsilon_{1}} \kappa+\frac{\varepsilon_{2}}{\varepsilon_{1}} \zeta, y_{2}\right): v_{\varepsilon}\left(\varepsilon_{2} \kappa+\varepsilon_{2} y_{2}\right) \varepsilon_{2}^{N} \mathrm{~d} y_{2}\right) \mathrm{d} y_{1} \mathrm{~d} \zeta \\
& \quad=\int_{Y_{1} \times Y_{2}}\left(\sum_{\kappa \in W_{\varepsilon_{2}}} \int_{\varepsilon_{2}\left(\kappa+Y_{2}\right)} \varphi\left(\varepsilon_{1}\left[\frac{\varepsilon_{2}}{\varepsilon_{1}} \kappa+\frac{\varepsilon_{2}}{\varepsilon_{1}} \zeta\right]+\varepsilon_{1} y_{1}, \frac{\varepsilon_{2}}{\varepsilon_{1}} \kappa+\frac{\varepsilon_{2}}{\varepsilon_{1}} \zeta, \frac{x}{\varepsilon_{2}}-\kappa\right): v_{\varepsilon}(x) \mathrm{d} x\right) \mathrm{d} y_{1} \mathrm{~d} \zeta  \tag{3.23}\\
& \quad=\int_{Y_{1} \times Y_{2}}\left(\int_{\Omega_{\varepsilon_{2}}} \varphi\left(\varepsilon_{1}\left[\frac{\varepsilon_{2}}{\varepsilon_{1}}\left[\frac{x}{\varepsilon_{2}}\right]+\frac{\varepsilon_{2}}{\varepsilon_{1}} \zeta\right]+\varepsilon_{1} y_{1}, \frac{\varepsilon_{2}}{\varepsilon_{1}}\left[\frac{x}{\varepsilon_{2}}\right]+\frac{\varepsilon_{2}}{\varepsilon_{1}} \zeta, \frac{x}{\varepsilon_{2}}\right): v_{\varepsilon}(x) \mathrm{d} x\right) \mathrm{d} y_{1} \mathrm{~d} \zeta \\
& \left.\quad=\int_{\Omega_{\varepsilon_{2} \times Y_{1} \times Y_{2}}} \varphi\left(\frac{\varepsilon_{2}}{\varepsilon_{1}}\left[\frac{x}{\varepsilon_{2}}\right]+\frac{\varepsilon_{2}}{\varepsilon_{1}} y_{2}\right]+\varepsilon_{1} y_{1}, \frac{\varepsilon_{2}}{\varepsilon_{1}}\left[\frac{x}{\varepsilon_{2}}\right]+\frac{\varepsilon_{2}}{\varepsilon_{1}} y_{2}, \frac{x}{\varepsilon_{2}}\right): v_{\varepsilon}(x) \mathrm{d} x \mathrm{~d} y_{1} \mathrm{~d} y_{2},
\end{align*}
$$

where in the fourth equality we used the $Y_{2}$-periodicity of $\psi_{2}$.
In view of (3.18)-(3.20) and (3.22)-(3.23), we conclude that

$$
\begin{align*}
& \int_{\Omega \times Y_{1} \times Y_{2}} \varphi\left(x, y_{1}, y_{2}\right): \mathcal{A}_{\varepsilon_{1}}\left(\mathcal{T}_{\varepsilon_{2}}\left(v_{\varepsilon}\right)\right)\left(x, y_{1}, y_{2}\right) \mathrm{d} x \mathrm{~d} y_{1} \mathrm{~d} y_{2} \\
& \quad=\int_{\Omega_{\varepsilon_{2}} \times Y_{1} \times Y_{2}} \phi\left(a_{\varepsilon}\left(x, y_{1}, y_{2}\right)\right) \psi_{1}\left(b_{\varepsilon}\left(x, y_{2}\right)\right) \psi_{2}\left(\frac{x}{\varepsilon_{2}}\right): v_{\varepsilon}(x) \mathrm{d} x \mathrm{~d} y_{1} \mathrm{~d} y_{2} \tag{3.24}
\end{align*}
$$

where

$$
a_{\varepsilon}\left(x, y_{1}, y_{2}\right):=\varepsilon_{1}\left[\frac{\varepsilon_{2}}{\varepsilon_{1}}\left[\frac{x}{\varepsilon_{2}}\right]+\frac{\varepsilon_{2}}{\varepsilon_{1}} y_{2}\right]+\varepsilon_{1} y_{1}, \quad b_{\varepsilon}\left(x, y_{2}\right):=\frac{\varepsilon_{2}}{\varepsilon_{1}}\left[\frac{x}{\varepsilon_{2}}\right]+\frac{\varepsilon_{2}}{\varepsilon_{1}} y_{2}, \quad x, y_{1}, y_{2} \in \mathbb{R}^{N} .
$$

Notice that for all $x \in \Omega, y_{1} \in Y_{1}$ and $y_{2} \in Y_{2}$,

$$
\begin{equation*}
\left|a_{\varepsilon}\left(x, y_{1}, y_{2}\right)-x\right| \leqslant 2 \sqrt{N}\left(\varepsilon_{1}+\varepsilon_{2}\right), \quad\left|b_{\varepsilon}\left(x, y_{2}\right)-\frac{x}{\varepsilon_{1}}\right| \leqslant 2 \sqrt{N} \frac{\varepsilon_{2}}{\varepsilon_{1}} . \tag{3.25}
\end{equation*}
$$

Using (3.24) and (3.17), we obtain

$$
\begin{align*}
& \left|\int_{\Omega \times Y_{1} \times Y_{2}} \varphi\left(x, y_{1}, y_{2}\right): \mathcal{A}_{\varepsilon_{1}}\left(\mathcal{T}_{\varepsilon_{2}}\left(v_{\varepsilon}\right)\right)\left(x, y_{1}, y_{2}\right) \mathrm{d} x \mathrm{~d} y_{1} \mathrm{~d} y_{2}-\int_{\Omega} \varphi\left(x, \frac{x}{\varepsilon_{1}}, \frac{x}{\varepsilon_{2}}\right): v_{\varepsilon}(x) \mathrm{d} x\right| \\
& =\left\lvert\, \int_{\Omega_{\varepsilon_{2} \times Y_{1} \times Y_{2}}} \phi\left(a_{\varepsilon}\left(x, y_{1}, y_{2}\right)\right) \psi_{1}\left(b_{\varepsilon}\left(x, y_{2}\right)\right) \psi_{2}\left(\frac{x}{\varepsilon_{2}}\right)\right.: v_{\varepsilon}(x) \mathrm{d} x \mathrm{~d} y_{1} \mathrm{~d} y_{2} \\
& \\
& -\int_{\Omega_{\varepsilon_{2} \times Y_{1} \times Y_{2}}} \phi(x) \psi_{1}\left(\frac{x}{\varepsilon_{1}}\right) \psi_{2}\left(\frac{x}{\varepsilon_{2}}\right): v_{\varepsilon}(x) \mathrm{d} x \mathrm{~d} y_{1} \mathrm{~d} y_{2} \mid  \tag{3.26}\\
& \leqslant\left\|\psi_{2}\right\|_{L_{\#}^{\infty}\left(Y_{2} ; \mathbb{R}^{d \times N}\right)} \int_{\Omega \times Y_{1} \times Y_{2}}\left|\phi\left(a_{\varepsilon}\left(x, y_{1}, y_{2}\right)\right) \psi_{1}\left(b_{\varepsilon}\left(x, y_{2}\right)\right)-\phi(x) \psi_{1}\left(\frac{x}{\varepsilon_{1}}\right)\right|\left|v_{\varepsilon}(x)\right| \mathrm{d} x \mathrm{~d} y_{1} \mathrm{~d} y_{2} \\
& \leqslant\left\|\psi_{2}\right\|_{L_{\#}^{\infty}\left(Y_{2} ; \mathbb{R}^{d \times N}\right)} \int_{\Omega \times Y_{1} \times Y_{2}}\left(\|\phi\|_{L^{\infty}(\Omega)} \operatorname{Lip}\left(\psi_{1}\right)\left|b_{\varepsilon}\left(x, y_{2}\right)-\frac{x}{\varepsilon_{1}}\right|\right. \\
& \left.\quad+\left\|\psi_{1}\right\|_{L_{\#}^{\infty}\left(Y_{1}\right)} \operatorname{Lip}(\phi)\left|a_{\varepsilon}\left(x, y_{1}, y_{2}\right)-x\right|\right)\left|v_{\varepsilon}(x)\right| \mathrm{d} x \mathrm{~d} y_{1} \mathrm{~d} y_{2} \\
& \leqslant
\end{align*}
$$

where in the last inequality we used (3.25) and the fact that $\sup _{\varepsilon}\left\|v_{\varepsilon}\right\|_{L^{1}\left(\Omega ; \mathbb{R}^{d \times N}\right)}<\infty$.
Since functions of the form $\varphi=\phi \psi_{1} \psi_{2}$ are dense in $C_{0}\left(\Omega ; C_{\#}\left(Y_{1} \times Y_{2} ; \mathbb{R}^{d \times N}\right)\right)$, and since $\left\{\mathcal{A}_{\varrho_{1}(\varepsilon)}\left(\mathcal{T}_{\varrho_{2}(\varepsilon)}\left(v_{\varepsilon}\right)\right)\right\} \subset$ $L^{1}\left(\Omega \times Y_{1} \times Y_{2} ; \mathbb{R}^{d \times N}\right),\left\{v_{\varepsilon}\right\} \subset L^{1}\left(\Omega ; \mathbb{R}^{d \times N}\right)$ are bounded sequences (see (3.3) and (3.5)), using a density argument, (1.1), and passing (3.26) to the limit as $\varepsilon \rightarrow 0^{+}$, we conclude that $v_{\varepsilon} \mathcal{L}^{N}{ }_{\lfloor\Omega} \frac{3-s c}{\varepsilon} \lambda$ if, and only if, $\mathcal{A}_{\varrho_{1}(\varepsilon)}\left(\mathcal{T}_{\varrho_{2}(\varepsilon)}\left(v_{\varepsilon}\right)\right) \mathcal{L}^{3 N^{2}}{ }_{\left\lfloor\Omega \times Y_{1} \times Y_{2}\right.} \stackrel{\star}{\star} \lambda$ weakly-ᄎ in $\mathcal{M}_{y \#}\left(\Omega \times Y_{1} \times Y_{2} ; \mathbb{R}^{d \times N}\right)$ as $\varepsilon \rightarrow 0^{+}$.

The next lemma is a Reshetnyak continuity type result for functions not necessarily positively 1-homogeneous, and similar to [40, Thm. 5] (see [30] for related results).

Lemma 3.5. Let $U \subset \mathbb{R}^{l}$ be an open set such that $\mathcal{L}^{l}(U)<\infty$. Let $g: U \times \mathbb{R}^{m} \rightarrow \mathbb{R}$ be a function such that $\bar{g}: U \times \mathbb{R}^{m} \times[0, \infty) \rightarrow \mathbb{R}$ defined by

$$
\bar{g}(z, \xi, t):=\left\{\begin{array}{cc}
t g\left(z, \frac{\xi}{t}\right) & \text { if } t>0,  \tag{3.27}\\
g^{\infty}(z, \xi) & \text { if } t=0,
\end{array}\right.
$$

is continuous and bounded on $U \times \mathbb{S}^{m}$, where $g^{\infty}(z, \xi):=\limsup _{t \rightarrow \infty} g(z, t \xi) / t$ is the recession function of $g$ and $\mathbb{S}^{m}$ is the unit sphere in $\mathbb{R}^{m} \times \mathbb{R}$. If $\lambda \in \mathcal{M}\left(U ; \mathbb{R}^{m}\right)$, let $\tilde{\lambda} \in \mathcal{M}\left(U ; \mathbb{R}^{m} \times \mathbb{R}\right)$ denote the measure defined by $\tilde{\lambda}(\cdot):=\left(\lambda(\cdot), \mathcal{L}^{l}(\cdot)\right)$. Assume that $\lambda_{j}, \lambda \in \mathcal{M}\left(U ; \mathbb{R}^{m}\right)$ are such that

$$
\begin{equation*}
\tilde{\lambda}_{j} \stackrel{\star}{j}_{j} \tilde{\lambda} \quad \text { weakly-ᄎ in } \mathcal{M}\left(U ; \mathbb{R}^{m} \times \mathbb{R}\right), \quad \lim _{j \rightarrow \infty}\left\|\tilde{\lambda}_{j}\right\|(U)=\|\tilde{\lambda}\|(U) . \tag{3.28}
\end{equation*}
$$

Then

$$
\begin{gather*}
\lim _{j \rightarrow \infty}\left\{\int_{U} g\left(z, \frac{\mathrm{~d} \lambda_{j}^{a c}}{\mathrm{~d} \mathcal{L}^{l}}(z)\right) \mathrm{d} z+\int_{U} g^{\infty}\left(z, \frac{\mathrm{~d} \lambda_{j}^{s}}{\mathrm{~d}\left\|\lambda_{j}^{s}\right\|}(z)\right) \mathrm{d}\left\|\lambda_{j}^{s}\right\|(z)\right\} \\
=\int_{U} g\left(z, \frac{\mathrm{~d} \lambda^{a c}}{\mathrm{~d} \mathcal{L}^{l}}(z)\right) \mathrm{d} z+\int_{U} g^{\infty}\left(z, \frac{\mathrm{~d} \lambda^{s}}{\mathrm{~d}\left\|\lambda^{s}\right\|}(z)\right) \mathrm{d}\left\|\lambda^{s}\right\|(z) \tag{3.29}
\end{gather*}
$$

Proof. Since $\bar{g}$ is a continuous and bounded function on $U \times \mathbb{S}^{m}$, in view of (3.28) Reshetnyak Continuity Theorem (see [45], and also [5, Thm. 2.39]) yields

$$
\begin{equation*}
\lim _{j \rightarrow \infty} \int_{U} \bar{g}\left(z, \frac{\mathrm{~d} \tilde{\lambda}_{j}}{\mathrm{~d}\left\|\tilde{\lambda}_{j}\right\|}(z)\right) \mathrm{d}\left\|\tilde{\lambda}_{j}\right\|(z)=\int_{U} \bar{g}\left(z, \frac{\mathrm{~d} \tilde{\lambda}}{\mathrm{~d}\|\tilde{\lambda}\|}(z)\right) \mathrm{d}\|\tilde{\lambda}\|(z) . \tag{3.30}
\end{equation*}
$$

We claim that (3.30) reduces to (3.29). In fact, writing the Lebesgue decomposition of an arbitrary $\mu \in \mathcal{M}\left(U ; \mathbb{R}^{m}\right)$ with respect to $\mathcal{L}^{l}$ as

$$
\mu=\frac{\mathrm{d} \mu^{a c}}{\mathrm{~d} \mathcal{L}^{l}} \mathcal{L}^{l}{ }{ }_{U U}+\mu^{s},
$$

then

$$
\begin{equation*}
\tilde{\mu}=\left(\frac{\mathrm{d} \mu^{a c}}{\mathrm{~d} \mathcal{L}^{l}}, 1\right) \mathcal{L}^{l}{ }_{L U}+\left(\mu^{s}, 0\right), \quad\|\tilde{\mu}\|=\left|\left(\frac{\mathrm{d} \mu^{a c}}{\mathrm{~d} \mathcal{L}^{l}}, 1\right)\right| \mathcal{L}^{l}{ }_{\lfloor U}+\left\|\mu^{s}\right\| \tag{3.31}
\end{equation*}
$$

are the Lebesgue decomposition of $\tilde{\mu}$ and $\|\tilde{\mu}\|$ with respect to $\mathcal{L}^{l}$, respectively.
In view of the Besicovitch Derivation Theorem, for $\mathcal{L}^{l}$-a.e. $z \in U$, we have

$$
\begin{equation*}
\frac{\mathrm{d} \tilde{\mu}}{\mathrm{~d}\|\tilde{\mu}\|}(z)=\frac{\left(\frac{\mathrm{d} \mu^{a c}}{\mathrm{~d} \mathcal{L}^{l}}(z), 1\right)}{\left|\left(\frac{\mathrm{d} \mu^{c}}{\mathrm{~d} \mathcal{L}^{l}}(z), 1\right)\right|}, \tag{3.32}
\end{equation*}
$$

and for $\left\|\mu^{s}\right\|$-a.e. $z \in U$, we have

$$
\begin{equation*}
\frac{\mathrm{d} \tilde{\mu}}{\mathrm{~d}\|\tilde{\mu}\|}(z)=\left(\frac{\mathrm{d} \mu^{s}}{\mathrm{~d}\left\|\mu^{s}\right\|}(z), 0\right) \tag{3.33}
\end{equation*}
$$

From (3.31)-(3.33), and taking into account the positive 1-homogeneity of $(\xi, t) \in \mathbb{R}^{m} \times[0, \infty) \mapsto \bar{g}(z, \xi, t)$, we deduce that

$$
\begin{align*}
\int_{U} \bar{g}\left(z, \frac{\mathrm{~d} \tilde{\mu}}{\mathrm{~d}\|\tilde{\mu}\|}(z)\right) \mathrm{d}\|\tilde{\mu}\|(z) & =\int_{U} \bar{g}\left(z, \frac{\mathrm{~d} \mu^{a c}}{\mathrm{~d} \mathcal{L}^{l}}(z), 1\right) \mathrm{d} z+\int_{U} \bar{g}\left(z, \frac{\mathrm{~d} \mu^{s}}{\mathrm{~d}\left\|\mu^{s}\right\|}(z), 0\right) \mathrm{d}\left\|\mu^{s}\right\|(z)  \tag{3.34}\\
& =\int_{U} g\left(z, \frac{\mathrm{~d} \mu^{a c}}{\mathrm{~d} \mathcal{L}^{l}}(z)\right) \mathrm{d} z+\int_{U} g^{\infty}\left(z, \frac{\mathrm{~d} \mu^{s}}{\mathrm{~d}\left\|\mu^{s}\right\|}(z)\right) \mathrm{d}\left\|\mu^{s}\right\|(z)
\end{align*}
$$

where in the last equality we used the definition of $\bar{g}$. By (3.34) we conclude that (3.30) reduces to (3.29).
Next we prove a Reshetnyak lower semicontinuity type result for functions not necessarily positively 1homogeneous (see also [25], [38]).

Lemma 3.6. Let $U \subset \mathbb{R}^{l}$ be an open set such that $\mathcal{L}^{l}(U)<\infty$. Let $g: U \times \mathbb{R}^{m} \rightarrow \mathbb{R}$ be a function satisfying $|g(z, \xi)| \leqslant C(1+|\xi|)$, for some $C>0$ and for every $(z, \xi) \in U \times \mathbb{R}^{m}$, and such that for all $z \in U, g(z, \cdot)$ is convex. Assume further that for all $\bar{z} \in U$ and $\delta>0$, there exists $\tau=\tau(\bar{z}, \delta)>0$ such that for all $z \in U$ with $|z-\bar{z}|<\tau$, and $\xi \in \mathbb{R}^{m}$, we have $|g(\bar{z}, \xi)-g(z, \xi)| \leqslant \delta(1+|\xi|)$. If $\lambda_{j}, \lambda \in \mathcal{M}\left(U ; \mathbb{R}^{m}\right)$ are such that $\lambda_{j} \stackrel{\star}{ }_{j} \lambda$ weakly-ᄎ in $\mathcal{M}\left(U ; \mathbb{R}^{m}\right)$ as $j \rightarrow \infty$, then

$$
\begin{align*}
& \liminf _{j \rightarrow \infty}\left\{\int_{U} g\left(z, \frac{\mathrm{~d} \lambda_{j}^{a c}}{\mathrm{~d} \mathcal{L}^{l}}(z)\right) \mathrm{d} z+\int_{U} g^{\infty}\left(z, \frac{\mathrm{~d} \lambda_{j}^{s}}{\mathrm{~d}\left\|\lambda_{j}^{s}\right\|}(z)\right) \mathrm{d}\left\|\lambda_{j}^{s}\right\|(z)\right\}  \tag{3.35}\\
& \geqslant \int_{U} g\left(z, \frac{\mathrm{~d} \lambda^{a c}}{\mathrm{~d} \mathcal{L}^{l}}(z)\right) \mathrm{d} z+\int_{U} g^{\infty}\left(z, \frac{\mathrm{~d} \lambda^{s}}{\mathrm{~d}\left\|\lambda^{s}\right\|}(z)\right) \mathrm{d}\left\|\lambda^{s}\right\|(z)
\end{align*}
$$

 $\mathcal{M}\left(U ; \mathbb{R}^{m} \times \mathbb{R}\right)$ as in Lemma 3.5, we see that $\tilde{\lambda}_{j} \stackrel{\star}{*}_{j} \tilde{\lambda}$ weakly- $\star$ in $\mathcal{M}\left(U ; \mathbb{R}^{m} \times \mathbb{R}\right)$.
Let $\bar{g}: U \times \mathbb{R}^{m} \times \mathbb{R} \rightarrow \mathbb{R}$ be the function introduced in (3.27). Then (see Remark 1.3 (ii)) $\bar{g}$ is a continuous function, and $|\bar{g}(z, \xi, t)| \leqslant 2 C|(\xi, t)|$ for all $(z, \xi, t) \in U \times \mathbb{R}^{m} \times[0, \infty)$. Moreover, since for each $i \in \mathbb{N}$ there exist functions $a_{i}: U \rightarrow \mathbb{R}$ and $b_{i}: U \rightarrow \mathbb{R}^{m}$ such that

$$
g(z, \xi)=\sup _{i \in \mathbb{N}}\left\{a_{i}(z)+b_{i}(z) \cdot \xi\right\}, \quad g^{\infty}(z, \xi)=\sup _{i \in \mathbb{N}}\left\{b_{i}(z) \cdot \xi\right\}
$$

(see [37, Prop. 2.77]), we have that for all $(z, \xi, t) \in U \times \mathbb{R}^{m} \times[0, \infty)$,

$$
\bar{g}(z, \xi, t)=\sup _{i \in \mathbb{N}}\left\{a_{i}(z) t+b_{i}(z) \cdot \xi\right\}
$$

Thus for all $z \in U,(\xi, t) \in \mathbb{R}^{m} \times[0, \infty) \mapsto \bar{g}(z, \xi, t)$ is convex and positively 1-homogeneous. So, Reshetnyak Lower Semicontinuity Theorem (see [45], and also [5, Thm. 2.38]) yields

$$
\begin{equation*}
\liminf _{j \rightarrow \infty} \int_{U} \bar{g}\left(z, \frac{\mathrm{~d} \tilde{\lambda}_{j}}{\mathrm{~d}\left\|\tilde{\lambda}_{j}\right\|}(z)\right) \mathrm{d}\left\|\tilde{\lambda}_{j}\right\|(z) \geqslant \int_{U} \bar{g}\left(z, \frac{\mathrm{~d} \tilde{\lambda}}{\mathrm{~d}\|\tilde{\lambda}\|}(z)\right) \mathrm{d}\|\tilde{\lambda}\|(z) . \tag{3.36}
\end{equation*}
$$

Finally, we observe that by (3.34), (3.36) reduces to (3.35).
Proof of Theorem 3.1. Fix $\left(u, \boldsymbol{\mu}_{1}, \boldsymbol{\mu}_{2}\right) \in B V\left(\Omega ; \mathbb{R}^{d}\right) \times \mathcal{M}_{\star}\left(\Omega ; B V_{\#}\left(Y_{1} ; \mathbb{R}^{d}\right)\right) \times \mathcal{M}_{\star}\left(\Omega \times Y_{1} ; B V_{\#}\left(Y_{2} ; \mathbb{R}^{d}\right)\right)$, and set

$$
\begin{aligned}
G\left(u, \boldsymbol{\mu}_{1}, \boldsymbol{\mu}_{2}\right):= & \int_{\Omega \times Y_{1} \times Y_{2}} f\left(y_{1}, y_{2}, \frac{\mathrm{~d} \lambda_{u, \boldsymbol{\mu}_{1}, \boldsymbol{\mu}_{2}}^{a c}}{\mathrm{~d} \mathcal{L}^{3 N}}\left(x, y_{1}, y_{2}\right)\right) \mathrm{d} x \mathrm{~d} y_{1} \mathrm{~d} y_{2} \\
& +\int_{\Omega \times Y_{1} \times Y_{2}} f^{\infty}\left(y_{1}, y_{2}, \frac{\mathrm{~d} \lambda_{u, \boldsymbol{\mu}_{1}, \boldsymbol{\mu}_{2}}^{s}}{\mathrm{~d}\left\|\lambda_{u, \boldsymbol{\mu}_{1}, \boldsymbol{\mu}_{2}}^{s}\right\|}\left(x, y_{1}, y_{2}\right)\right) \mathrm{d}\left\|\lambda_{u, \boldsymbol{\mu}_{1}, \boldsymbol{\mu}_{2}}^{s}\right\|\left(x, y_{1}, y_{2}\right) .
\end{aligned}
$$

We will proceed in two steps.
Step 1. We start by proving that

$$
F^{\mathrm{sc}}\left(u, \boldsymbol{\mu}_{1}, \boldsymbol{\mu}_{2}\right) \geqslant G\left(u, \boldsymbol{\mu}_{1}, \boldsymbol{\mu}_{2}\right) .
$$

Let $\left\{\varepsilon_{h}\right\}_{h \in \mathbb{N}}$ be an arbitrary sequence of positive numbers converging to zero as $h \rightarrow \infty$, and by Proposition 2.4 let $\left\{u_{h}\right\}_{h \in \mathbb{N}} \subset B V\left(\Omega ; \mathbb{R}^{d}\right)$ be a bounded sequence such that $D u_{h} \frac{3-s c}{\varepsilon_{h}} \lambda_{u, \mu_{1}, \mu_{2}}$. We claim that

$$
\begin{equation*}
\liminf _{h \rightarrow \infty} F_{\varepsilon_{h}}\left(u_{h}\right) \geqslant G\left(u, \boldsymbol{\mu}_{1}, \boldsymbol{\mu}_{2}\right) . \tag{3.37}
\end{equation*}
$$

Since $\left\{D u_{h}\right\}_{h \in \mathbb{N}}$ is bounded in $\mathcal{M}\left(\Omega ; \mathbb{R}^{d \times N}\right)$ (see Remark 2.5), in view of $(\mathcal{F} 3),(\mathcal{F} 4)^{\star}$ and (3.2), we have that $\left\{F_{\varepsilon_{h}}\left(u_{h}\right)\right\}_{h \in \mathbb{N}}$ is bounded. Therefore, we may assume without loss of generality that the limit inferior in (3.37) is actually a limit and that this limit is finite (which is true up to a subsequence).
By Proposition 2.6 (with $\boldsymbol{\mu}_{i}=0$ ), for each $h \in \mathbb{N}$ we can find a sequence $\left\{u_{j}^{(h)}\right\}_{j \in \mathbb{N}} \subset W^{1,1}\left(\Omega ; \mathbb{R}^{d}\right)$ such that

$$
\begin{array}{ll}
u_{j}^{(h)} \stackrel{\star}{y}_{j} u_{h} & \text { weakly-ぇ in } B V\left(\Omega ; \mathbb{R}^{d}\right), \\
\tilde{\lambda}_{j}^{(h)} \stackrel{\star}{*}_{j} \tilde{\lambda}_{h} & \text { weakly-ぇ in } \mathcal{M}\left(\Omega ; \mathbb{R}^{d \times N} \times \mathbb{R}\right), \quad \lim _{j \rightarrow \infty}\left\|\tilde{\lambda}_{j}^{(h)}\right\|(\Omega)=\left\|\tilde{\lambda}_{h}\right\|(\Omega), \tag{3.38}
\end{array}
$$

where, for $B \in \mathcal{B}(\Omega)$,

$$
\tilde{\lambda}_{j}^{(h)}(B):=\left(\int_{B} \nabla u_{j}^{(h)}(x) \mathrm{d} x, \mathcal{L}^{N}(B)\right), \quad \tilde{\lambda}_{h}(B):=\left(D u_{h}(B), \mathcal{L}^{N}(B)\right) .
$$

Under hypotheses $(\mathcal{F} 1)-(\mathcal{F} 3),(\mathcal{F} 4)^{\star},(\mathcal{F} 5)$ (see also Remark 1.3 (ii)), it can be shown that for fixed $h \in \mathbb{N}$, Lemma 3.5 applies to $U:=\Omega$ and $g(x, \xi):=f\left(\frac{x}{\varrho_{1}\left(\varepsilon_{h}\right)}, \frac{x}{\varrho_{2}\left(\varepsilon_{h}\right)}, \xi\right)$, which ensures the continuity of the functional $F_{\varepsilon_{h}}$ with respect to the convergence (3.38), that is, $\lim _{j \rightarrow \infty} F_{\varepsilon_{h}}\left(u_{j}^{(h)}\right)=F_{\varepsilon_{h}}\left(u_{h}\right)$. Consequently,

$$
\begin{equation*}
\lim _{h \rightarrow \infty} \lim _{j \rightarrow \infty} F_{\varepsilon_{h}}\left(u_{j}^{(h)}\right)=\lim _{h \rightarrow \infty} F_{\varepsilon_{h}}\left(u_{h}\right) \tag{3.39}
\end{equation*}
$$

Moreover, given $\varphi \in C_{0}\left(\Omega ; C_{\#}\left(Y_{1} \times Y_{2} ; \mathbb{R}^{d \times N}\right)\right)$ we have

$$
\begin{align*}
\lim _{h \rightarrow \infty} \lim _{j \rightarrow \infty} \int_{\Omega} \varphi\left(x, \frac{x}{\varrho_{1}\left(\varepsilon_{h}\right)}, \frac{x}{\varrho_{2}\left(\varepsilon_{h}\right)}\right): \nabla u_{j}^{(h)}(x) \mathrm{d} x & =\lim _{h \rightarrow \infty} \int_{\Omega} \varphi\left(x, \frac{x}{\varrho_{1}\left(\varepsilon_{h}\right)}, \frac{x}{\varrho_{2}\left(\varepsilon_{h}\right)}\right): \mathrm{d} D u_{h}(x) \\
& =\int_{\Omega \times Y_{1} \times Y_{2}} \varphi\left(x, y_{1}, y_{2}\right): \mathrm{d} \lambda_{u, \boldsymbol{\mu}_{1}, \boldsymbol{\mu}_{2}}\left(x, y_{1}, y_{2}\right) \tag{3.40}
\end{align*}
$$

 $D u_{h} \frac{3-s c}{\varepsilon_{h}} \lambda_{u, \boldsymbol{\mu}_{1}, \boldsymbol{\mu}_{2}}$. In addition, in view of (3.38),

$$
\begin{equation*}
\sup _{h \in \mathbb{N}} \sup _{j \in \mathbb{N}} \int_{\Omega}\left|\nabla u_{j}^{(h)}(x)\right| \mathrm{d} x<\infty \tag{3.41}
\end{equation*}
$$

Using the separability of $C_{0}\left(\Omega ; C_{\#}\left(Y_{1} \times Y_{2} ; \mathbb{R}^{d \times N}\right)\right)$ and a diagonalization argument, from (3.39), (3.40) and (3.41), we can find a sequence $\left\{j_{h}\right\}$ such that $j_{h} \rightarrow \infty$ as $h \rightarrow \infty$, and such that $w_{h}:=u_{j_{h}}^{(h)}$ satisfies

$$
\begin{equation*}
w_{h} \in W^{1,1}\left(\Omega ; \mathbb{R}^{d}\right), \quad \nabla w_{h} \mathcal{L}^{N}{ }_{\lfloor\Omega} \frac{3-s c}{\varepsilon_{h}} \lambda_{u, \mu_{1}, \mu_{2}}, \quad \lim _{h \rightarrow \infty} F_{\varepsilon_{h}}\left(w_{h}\right)=\lim _{h \rightarrow \infty} F_{\varepsilon_{h}}\left(u_{h}\right) \tag{3.42}
\end{equation*}
$$

Set $c:=\sup _{h}\left\|\nabla w_{h}\right\|_{L^{1}\left(\Omega ; \mathbb{R}^{d \times N}\right)}<\infty$ and fix $\eta>0$. Then by Lemmas 3.2 and 3.4, and by Lemma 3.6 applied to $U:=\Omega \times Y_{1} \times Y_{2}$ and $g\left(x, y_{1}, y_{2}, \xi\right):=f_{\eta}\left(y_{1}, y_{2}, \xi\right)$, where $f_{\eta}\left(y_{1}, y_{2}, \xi\right):=f\left(y_{1}, y_{2}, \xi\right)+\eta|\xi|$, we conclude that

$$
\begin{align*}
& \lim _{h \rightarrow \infty} F_{\varepsilon_{h}}\left(u_{h}\right)+\eta c=\lim _{h \rightarrow \infty} F_{\varepsilon_{h}}\left(w_{h}\right)+\eta c \geqslant \liminf _{h \rightarrow \infty} \int_{\Omega} f_{\eta}\left(\frac{x}{\varrho_{1}\left(\varepsilon_{h}\right)}, \frac{x}{\varrho_{2}\left(\varepsilon_{h}\right)}, \nabla w_{h}(x)\right) \mathrm{d} x  \tag{3.43}\\
& \quad \geqslant \liminf _{h \rightarrow \infty} \int_{\Omega \times Y_{1} \times Y_{2}} f_{\eta}\left(y_{1}, y_{2}, \mathcal{A}_{\varrho_{1}\left(\varepsilon_{h}\right)}\left(\mathcal{T}_{\varrho_{2}\left(\varepsilon_{h}\right)}\left(\nabla w_{h}\right)\right)\left(x, y_{1}, y_{2}\right)\right) \mathrm{d} x \mathrm{~d} y_{1} \mathrm{~d} y_{2} \geqslant F_{\eta}^{\mathrm{sc}}\left(u, \boldsymbol{\mu}_{1}, \boldsymbol{\mu}_{2}\right)
\end{align*}
$$

where

$$
\begin{align*}
F_{\eta}^{\mathrm{sc}}\left(u, \boldsymbol{\mu}_{1}, \boldsymbol{\mu}_{2}\right):= & \int_{\Omega \times Y_{1} \times Y_{2}} f_{\eta}\left(y_{1}, y_{2}, \frac{\mathrm{~d} \lambda_{u, \boldsymbol{\mu}_{1}, \boldsymbol{\mu}_{2}}^{a c}}{\mathrm{~d} \mathcal{L}^{3 N}}\left(x, y_{1}, y_{2}\right)\right) \mathrm{d} x \mathrm{~d} y_{1} \mathrm{~d} y_{2}  \tag{3.44}\\
& +\int_{\Omega \times Y_{1} \times Y_{2}} f_{\eta}^{\infty}\left(y_{1}, y_{2}, \frac{\mathrm{~d} \lambda_{u, \boldsymbol{\mu}_{1}, \boldsymbol{\mu}_{2}}^{s}}{\mathrm{~d}\left\|\lambda_{u, \boldsymbol{\mu}_{1}, \boldsymbol{\mu}_{2}}^{s}\right\|}\left(x, y_{1}, y_{2}\right)\right) \mathrm{d}\left\|\lambda_{u, \boldsymbol{\mu}_{1}, \boldsymbol{\mu}_{2}}^{s}\right\|\left(x, y_{1}, y_{2}\right)
\end{align*}
$$

Since $f_{\eta}^{\infty}\left(y_{1}, y_{2}, \xi\right)=f^{\infty}\left(y_{1}, y_{2}, \xi\right)+\eta|\xi|$, from (3.43) we deduce that

$$
\lim _{h \rightarrow \infty} F_{\varepsilon_{h}}\left(u_{h}\right)+\eta c \geqslant G\left(u, \boldsymbol{\mu}_{1}, \boldsymbol{\mu}_{2}\right)+\eta\left\|\lambda_{u, \boldsymbol{\mu}_{1}, \boldsymbol{\mu}_{2}}\right\|\left(\Omega \times Y_{1} \times Y_{2}\right)
$$

Finally, letting $\eta \rightarrow 0^{+}$we obtain (3.37).
Step 2. We prove that

$$
\begin{equation*}
F^{\mathrm{sc}}\left(u, \boldsymbol{\mu}_{1}, \boldsymbol{\mu}_{2}\right) \leqslant G\left(u, \boldsymbol{\mu}_{1}, \boldsymbol{\mu}_{2}\right) \tag{3.45}
\end{equation*}
$$

Let $\left\{\varepsilon_{h}\right\}_{h \in \mathbb{N}}$ be a sequence of positive numbers converging to zero as $h \rightarrow \infty$, and let $\left\{u_{j}\right\}_{j \in \mathbb{N}} \subset C^{\infty}\left(\bar{\Omega} ; \mathbb{R}^{d}\right)$, $\left\{\psi_{j}^{(1)}\right\}_{j \in \mathbb{N}} \subset C_{c}^{\infty}\left(\Omega ; C_{\#}^{\infty}\left(Y_{1} ; \mathbb{R}^{d}\right)\right)$ and $\left\{\psi_{j}^{(2)}\right\}_{j \in \mathbb{N}} \subset C_{c}^{\infty}\left(\Omega ; C_{\#}^{\infty}\left(Y_{1} \times Y_{2} ; \mathbb{R}^{d}\right)\right)$ be the sequences given by Proposition 2.6. For each $h, j \in \mathbb{N}$ define $u_{h, j} \in C^{\infty}\left(\bar{\Omega} ; \mathbb{R}^{d}\right)$ by

$$
\begin{equation*}
u_{h, j}(x):=u_{j}(x)+\varrho_{1}\left(\varepsilon_{h}\right) \psi_{j}^{(1)}\left(x, \frac{x}{\varrho_{1}\left(\varepsilon_{h}\right)}\right)+\varrho_{2}\left(\varepsilon_{h}\right) \psi_{j}^{(2)}\left(x, \frac{x}{\varrho_{1}\left(\varepsilon_{h}\right)}, \frac{x}{\varrho_{2}\left(\varepsilon_{h}\right)}\right) \tag{3.46}
\end{equation*}
$$

Using (1.1), (2.44), and (2.2), in this order, we have that for all $\varphi \in C_{0}\left(\Omega ; C_{\#}\left(Y_{1} \times Y_{2} ; \mathbb{R}^{d \times N}\right)\right)$

$$
\begin{equation*}
\lim _{j \rightarrow \infty} \lim _{h \rightarrow \infty} \int_{\Omega} \varphi\left(x, \frac{x}{\varrho_{1}\left(\varepsilon_{h}\right)}, \frac{x}{\varrho_{2}\left(\varepsilon_{h}\right)}\right): \nabla u_{h, j}(x) \mathrm{d} x=\int_{\Omega \times Y_{1} \times Y_{2}} \varphi\left(x, y_{1}, y_{2}\right): \mathrm{d} \lambda_{u, \boldsymbol{\mu}_{1}, \boldsymbol{\mu}_{2}}\left(x, y_{1}, y_{2}\right) \tag{3.47}
\end{equation*}
$$

Moreover,

$$
\begin{aligned}
& F_{\varepsilon_{h}}\left(u_{h, j}\right)=\int_{\Omega} f\left(\frac{x}{\varrho_{1}\left(\varepsilon_{h}\right)}, \frac{x}{\varrho_{2}\left(\varepsilon_{h}\right)}, \nabla u_{h, j}(x)\right) \mathrm{d} x \\
& \quad=\int_{\Omega} f\left(\frac{x}{\varrho_{1}\left(\varepsilon_{h}\right)}, \frac{x}{\varrho_{2}\left(\varepsilon_{h}\right)}, \nabla u_{j}(x)+\left(\nabla_{y_{1}} \psi_{j}^{(1)}\right)\left(x, \frac{x}{\varrho_{1}\left(\varepsilon_{h}\right)}\right)+\left(\nabla_{y_{2}} \psi_{j}^{(2)}\right)\left(x, \frac{x}{\varrho_{1}\left(\varepsilon_{h}\right)}, \frac{x}{\varrho_{2}\left(\varepsilon_{h}\right)}\right)+\vartheta_{h, j}(x)\right) \mathrm{d} x
\end{aligned}
$$

where

$$
\begin{aligned}
& \vartheta_{h, j}(x):=\varrho_{1}\left(\varepsilon_{h}\right)\left(\nabla_{x} \psi_{j}^{(1)}\right)\left(x, \frac{x}{\varrho_{1}\left(\varepsilon_{h}\right)}\right)+\varrho_{2}\left(\varepsilon_{h}\right)\left(\nabla_{x} \psi_{j}^{(2)}\right)\left(x, \frac{x}{\varrho_{1}\left(\varepsilon_{h}\right)}, \frac{x}{\varrho_{2}\left(\varepsilon_{h}\right)}\right) \\
&+\frac{\varrho_{2}\left(\varepsilon_{h}\right)}{\varrho_{1}\left(\varepsilon_{h}\right)}\left(\nabla_{y_{1}} \psi_{j}^{(2)}\right)\left(x, \frac{x}{\varrho_{1}\left(\varepsilon_{h}\right)}, \frac{x}{\varrho_{2}\left(\varepsilon_{h}\right)}\right) .
\end{aligned}
$$

Taking into account (1.1), in view of Lemma 2.10 for each $j \in \mathbb{N}$ we can find a positive constant $C_{j}$ independent of $\varepsilon$ such that

$$
\begin{align*}
F_{\varepsilon_{h}}\left(u_{h, j}\right) \leqslant & \int_{\Omega} f\left(\frac{x}{\varrho_{1}\left(\varepsilon_{h}\right)}, \frac{x}{\varrho_{2}\left(\varepsilon_{h}\right)}, \nabla u_{j}(x)+\left(\nabla_{y_{1}} \psi_{j}^{(1)}\right)\left(x, \frac{x}{\varrho_{1}\left(\varepsilon_{h}\right)}\right)+\left(\nabla_{y_{2}} \psi_{j}^{(2)}\right)\left(x, \frac{x}{\varrho_{1}\left(\varepsilon_{h}\right)}, \frac{x}{\varrho_{2}\left(\varepsilon_{h}\right)}\right)\right) \mathrm{d} x \\
& +C_{j} \int_{\Omega}\left|\vartheta_{h, j}(x)\right| \mathrm{d} x \tag{3.48}
\end{align*}
$$

with, for all $j \in \mathbb{N}$,

$$
\begin{equation*}
\lim _{h \rightarrow \infty} \int_{\Omega}\left|\vartheta_{h, j}(x)\right| \mathrm{d} x=0 \tag{3.49}
\end{equation*}
$$

Furthermore, the function

$$
g_{j}\left(x, y_{1}, y_{2}\right):=f\left(y_{1}, y_{2}, \nabla u_{j}(x)+\left(\nabla_{y_{1}} \psi_{j}^{(1)}\right)\left(x, y_{1}\right)+\left(\nabla_{y_{2}} \psi_{j}^{(2)}\right)\left(x, y_{1}, y_{2}\right)\right)
$$

belongs to $C\left(\bar{\Omega} ; C_{\#}\left(Y_{1} \times Y_{2}\right)\right)$, hence by $(2.44)$

$$
\begin{equation*}
\lim _{h \rightarrow \infty} \int_{\Omega} g_{j}\left(x, \frac{x}{\varrho_{1}\left(\varepsilon_{h}\right)}, \frac{x}{\varrho_{2}\left(\varepsilon_{h}\right)}\right) \mathrm{d} x=\int_{\Omega \times Y_{1} \times Y_{2}} g_{j}\left(x, y_{1}, y_{2}\right) \mathrm{d} x \mathrm{~d} y_{1} \mathrm{~d} y_{2} \tag{3.50}
\end{equation*}
$$

From (3.48)-(3.50) we conclude that

$$
\begin{align*}
& \limsup _{j \rightarrow \infty} \limsup _{h \rightarrow \infty} F_{\varepsilon_{h}}\left(u_{h, j}\right) \\
& \quad \leqslant \limsup _{j \rightarrow \infty} \int_{\Omega \times Y_{1} \times Y_{2}} f\left(y_{1}, y_{2}, \nabla u_{j}(x)+\left(\nabla_{y_{1}} \psi_{j}^{(1)}\right)\left(x, y_{1}\right)+\left(\nabla_{y_{2}} \psi_{j}^{(2)}\right)\left(x, y_{1}, y_{2}\right)\right) \mathrm{d} x \mathrm{~d} y_{1} \mathrm{~d} y_{2}  \tag{3.51}\\
& \quad=G\left(u, \boldsymbol{\mu}_{1}, \boldsymbol{\mu}_{2}\right)
\end{align*}
$$

where in the last equality we invoked Lemma 3.5 applied to $U:=\Omega \times Y_{1} \times Y_{2}$ and $g\left(x, y_{1}, y_{2}, \xi\right):=f\left(y_{1}, y_{2}, \xi\right)$, and also (2.3).
Using the separability of $C_{0}\left(\Omega ; C_{\#}\left(Y_{1} \times Y_{2} ; \mathbb{R}^{d \times N}\right)\right)$ and a diagonalization argument, from (3.47) and (3.51), and noticing that $\left\{u_{h, j}\right\}_{h, j \in \mathbb{N}}$ is a bounded sequence in $W^{1,1}\left(\Omega ; \mathbb{R}^{d}\right)$, we can find subsequences $h_{k} \prec h$ and $j_{k} \prec j$ such that $u_{h_{k}, j_{k}} \in C^{\infty}\left(\bar{\Omega} ; \mathbb{R}^{d}\right)$ satisfies

$$
\begin{equation*}
\nabla u_{h_{k}, j_{k}} \mathcal{L}^{N}{ }_{\lfloor\Omega} \frac{3-s c}{\varepsilon_{h_{k}}} \lambda_{u, \boldsymbol{\mu}_{1}, \boldsymbol{\mu}_{2}}, \quad \limsup _{k \rightarrow \infty} F_{\varepsilon_{h_{k}}}\left(u_{h_{k}, j_{k}}\right) \leqslant G\left(u, \boldsymbol{\mu}_{1}, \boldsymbol{\mu}_{2}\right) . \tag{3.52}
\end{equation*}
$$

Finally, consider the sequence $\left\{w_{h}\right\}_{h \in \mathbb{N}} \subset B V\left(\Omega ; \mathbb{R}^{d}\right)$ defined by

$$
w_{h}:= \begin{cases}u_{h_{k}, j_{k}} & \text { if } h=h_{k} \text { for some } k \in \mathbb{N}, \\ v_{h} & \text { if } h \neq h_{k} \text { for all } k \in \mathbb{N},\end{cases}
$$

where $\left\{v_{h}\right\}_{h \in \mathbb{N}} \subset B V\left(\Omega ; \mathbb{R}^{d}\right)$ is a sequence such that $D v_{h} \frac{3-s c}{\varepsilon_{h}} \lambda_{u, \mu_{1}, \mu_{2}}$ (which exists by Proposition 2.4). Then $D w_{h} \frac{3-s c}{\varepsilon_{h}} \lambda_{u, \boldsymbol{\mu}_{1}, \boldsymbol{\mu}_{2}}$, and so by (3.52)

$$
F^{\mathrm{sc}}\left(u, \boldsymbol{\mu}_{1} \boldsymbol{\mu}_{2}\right) \leqslant \liminf _{h \rightarrow \infty} F_{\varepsilon_{h}}\left(w_{h}\right) \leqslant \limsup _{k \rightarrow \infty} F_{\varepsilon_{h_{k}}}\left(u_{h_{k}, j_{k}}\right) \leqslant G\left(u, \boldsymbol{\mu}_{1}, \boldsymbol{\mu}_{2}\right)
$$

This concludes the proof of Theorem 3.1.
The next theorem concerns the first equality in (1.7) relating the three-scale homogenized functional, $F^{\mathrm{sc}}$, and the effective energy, $F^{\text {hom }}$.

Theorem 3.7. Under the hypotheses of Theorem 3.1, assume further that the length scales $\varrho_{1}, \varrho_{2}$ satisfy the condition (1.2). Then, for all $u \in B V\left(\Omega ; \mathbb{R}^{d}\right)$,

$$
F^{\mathrm{hom}}(u)=\inf _{\substack{\mu_{1} \in \mathcal{M}_{\star}\left(\Omega ; B V_{\#}\left(Y_{1} ; \mathbb{R}^{d}\right)\right) \\ \mu_{2} \in \mathcal{M}_{\star}\left(\Omega \times Y_{1} ; B V_{\#}\left(Y_{2} ; \mathbb{R}^{d}\right)\right)}} F^{\mathrm{sc}}\left(u, \boldsymbol{\mu}_{1}, \boldsymbol{\mu}_{2}\right) .
$$

Proof. Let $u \in B V\left(\Omega ; \mathbb{R}^{d}\right)$ be given. We will proceed in two steps.
Step 1. We prove that

$$
\begin{equation*}
F^{\mathrm{hom}}(u) \geqslant \inf _{\substack{\mu_{1} \in \mathcal{M}_{\star}\left(\Omega ; B V_{\#}\left(Y_{1} ; \mathbb{R}^{d}\right)\right) \\ \mu_{2} \in \mathcal{M}_{\star}\left(\Omega \times Y_{1} ; B V_{\#}\left(Y_{2} ; \mathbb{R}^{d} d\right)\right)}} F^{\mathrm{sc}}\left(u, \boldsymbol{\mu}_{1}, \boldsymbol{\mu}_{2}\right) \tag{3.53}
\end{equation*}
$$

Let $\left\{\varepsilon_{h}\right\}_{h \in \mathbb{N}}$ be an arbitrary sequence of positive numbers converging to zero as $h \rightarrow \infty$, and let $\left\{u_{h}\right\}_{h \in \mathbb{N}} \subset B V\left(\Omega ; \mathbb{R}^{d}\right)$ be a sequence weakly-丸 converging to $u$ in $B V\left(\Omega ; \mathbb{R}^{d}\right)$ as $h \rightarrow \infty$. By $(\mathcal{F} 3),(\mathcal{F} 4)^{\star}$ and (3.2), $\liminf _{h \rightarrow \infty} F_{\varepsilon_{h}}\left(u_{h}\right) \in \mathbb{R}$. Using Theorem 2.3, we can find a subsequence $h_{k} \prec h$ and measures $\overline{\boldsymbol{\mu}}_{1} \in \mathcal{M}_{\star}\left(\Omega ; B V_{\#}\left(Y_{1} ; \mathbb{R}^{d}\right)\right), \overline{\boldsymbol{\mu}}_{2} \in \mathcal{M}_{\star}\left(\Omega \times Y_{1} ; B V_{\#}\left(Y_{2} ; \mathbb{R}^{d}\right)\right)$, such that

$$
\lim _{k \rightarrow \infty} F_{\varepsilon_{h_{k}}}\left(u_{h_{k}}\right)=\liminf _{h \rightarrow \infty} F_{\varepsilon_{h}}\left(u_{h}\right), \quad u_{h_{k}} \frac{3-s c}{\varepsilon_{h_{k}}} u \mathcal{L}^{N}{ }_{\lfloor\Omega} \otimes \mathcal{L}_{y_{1}, y_{2}}^{2 N}, \quad D u_{h_{k}} \frac{3-s c}{\varepsilon_{h_{k}}} \lambda_{u, \bar{\mu}_{1}, \bar{\mu}_{2}} .
$$

Hence, taking into account Theorem 3.1 (see (3.37)),

$$
\inf _{\substack{\boldsymbol{\mu}_{1} \in \mathcal{M}_{\star}\left(\Omega ; B V_{\#}\left(Y_{1} ; \mathbb{R}^{d}\right)\right) \\ \boldsymbol{\mu}_{2} \in \mathcal{M}_{\star}\left(\Omega \times Y_{1} ; B V_{\#}\left(Y_{2} ; \mathbb{R}^{d}\right)\right)}} F^{\mathrm{sc}}\left(u, \boldsymbol{\mu}_{1}, \boldsymbol{\mu}_{2}\right) \leqslant F^{\mathrm{sc}}\left(u, \overline{\boldsymbol{\mu}}_{1}, \overline{\boldsymbol{\mu}}_{2}\right) \leqslant \liminf _{h \rightarrow \infty} F_{\varepsilon_{h}}\left(u_{h}\right) .
$$

Taking the infimum over all sequences $\left\{u_{h}\right\}_{h \in \mathbb{N}}$ as above, we deduce that (3.53) holds.
Step 2. We show that

$$
\begin{equation*}
F^{\mathrm{hom}}(u) \leqslant \inf _{\substack{\mu_{1} \in \mathcal{M}_{\star}\left(\Omega, B V_{\#}\left(Y_{1} ; \mathbb{R}^{d}\right)\right) \\ \mu_{2} \in \mathcal{M}_{\star}\left(\Omega \times Y_{1} ; B V_{\#}\left(Y_{2} ; \mathbb{R}^{d}\right)\right)}} F^{\mathrm{sc}}\left(u, \boldsymbol{\mu}_{1}, \boldsymbol{\mu}_{2}\right) . \tag{3.54}
\end{equation*}
$$

Let $\left\{\varepsilon_{h}\right\}_{h \in \mathbb{N}}$ be an arbitrary sequence of positive numbers converging to zero as $h \rightarrow \infty$, and take $\boldsymbol{\mu}_{1} \in \mathcal{M}_{\star}\left(\Omega ; B V_{\#}\left(Y_{1} ; \mathbb{R}^{d}\right)\right), \boldsymbol{\mu}_{2} \in \mathcal{M}_{\star}\left(\Omega \times Y_{1} ; B V_{\#}\left(Y_{2} ; \mathbb{R}^{d}\right)\right)$. Reasoning as in the proof of (3.45), we can find a subsequence $h_{k} \prec h$ and a sequence $\left\{v_{k}\right\}_{k \in \mathbb{N}} \subset C^{\infty}\left(\bar{\Omega} ; \mathbb{R}^{d}\right)$ such that (see (3.46) and (3.52))

$$
\lim _{k \rightarrow \infty} \int_{\Omega}\left|v_{k}-u\right| \mathrm{d} x=0, \quad \nabla v_{k} \mathcal{L}^{N}{ }_{\lfloor\Omega} \frac{3-s c}{\varepsilon_{h_{k}}} \lambda_{u, \boldsymbol{\mu}_{1}, \boldsymbol{\mu}_{2}}, \quad \limsup _{k \rightarrow \infty} F_{\varepsilon_{h_{k}}}\left(v_{k}\right) \leqslant F^{\mathrm{sc}}\left(u, \boldsymbol{\mu}_{1}, \boldsymbol{\mu}_{2}\right) .
$$

Consequently, we also have that $D v_{k} \stackrel{\star}{乙} D u$ weakly- $\star$ in $\mathcal{M}\left(\Omega ; \mathbb{R}^{d \times N}\right)$ as $k \rightarrow \infty$. Finally, define

$$
u_{h}:= \begin{cases}v_{k} & \text { if } h=h_{k} \text { for some } k \in \mathbb{N}, \\ u & \text { otherwise. }\end{cases}
$$

Then $u_{h} \stackrel{\star}{ } u$ weakly-ᄎ in $B V\left(\Omega ; \mathbb{R}^{d}\right)$ as $h \rightarrow \infty$, so that

$$
F^{\mathrm{hom}}(u) \leqslant \liminf _{h \rightarrow \infty} F_{\varepsilon_{h}}\left(u_{h}\right) \leqslant \limsup _{k \rightarrow \infty} F_{\varepsilon_{h_{k}}}\left(v_{k}\right) \leqslant F^{\mathrm{sc}}\left(u, \boldsymbol{\mu}_{1}, \boldsymbol{\mu}_{2}\right)
$$

from which we get (3.54) by taking the infimum over all $\mu_{1} \in \mathcal{M}_{\star}\left(\Omega ; B V_{\#}\left(Y_{1} ; \mathbb{R}^{d}\right)\right)$ and $\boldsymbol{\mu}_{2} \in \mathcal{M}_{\star}(\Omega \times$ $\left.Y_{1} ; B V_{\#}\left(Y_{2} ; \mathbb{R}^{d}\right)\right)$.

Remark 3.8. We observe that Theorems 3.1 and 3.7 hold if $(\mathcal{F} 4)^{\star}$ is replaced by ( $\mathcal{F} 4$ ) (see also Remark 1.3 (i)).

In order to establish the integral representation for the effective energy $F^{\text {hom }}$ stated in Theorem 1.1 we will need some auxiliary results. The first one is a measurable selection criterion (see [36, Lemma 3.10]; see also [19]).

Lemma 3.9. Let $Z$ be a separable metric space, let $T$ be a measurable space and let $\Gamma: T \rightarrow 2^{Z}$ be a multifunction such that for every $t \in T, \Gamma(t) \subset Z$ is nonempty and open, and for every $z \in Z$, $\{t \in T: z \in \Gamma(t)\}$ is measurable. Then $\Gamma$ admits a measurable selection, i.e., there exists a measurable function $\gamma: T \rightarrow Z$ such that for all $t \in T, \gamma(t) \in \Gamma(t)$.

Next, we observe that the following result is a simple consequence of [40, Thm. 6] (see also [25] in the case where $d=1$ and $g$ is coercive).

Lemma 3.10. Assume that $\Omega \subset \mathbb{R}^{N}$ is an open and bounded set with $\partial \Omega$ Lipschitz, and let $g: \mathbb{R}^{d \times N} \rightarrow \mathbb{R}$ be a convex function such that for all $\xi \in \mathbb{R}^{d \times N}$ and for some constant $M>0,|g(\xi)| \leqslant M(1+|\xi|)$. Then, for all $\delta>0$ and for all $u \in B V\left(\Omega ; \mathbb{R}^{d \times N}\right)$, there exists a sequence $\left\{u_{j}\right\}_{j \in \mathbb{N}} \subset W^{1,1}\left(\Omega ; \mathbb{R}^{d \times N}\right)$ such that $u_{j} \stackrel{\star}{\rightleftharpoons} u$ weakly-ᄎ in $B V\left(\Omega ; \mathbb{R}^{d \times N}\right)$ as $j \rightarrow \infty$, and

$$
\int_{\Omega} g(\nabla u(x)) \mathrm{d} x+\int_{\Omega} g^{\infty}\left(\frac{\mathrm{d} D^{s} u}{\mathrm{~d}\left\|D^{s} u\right\|}(x)\right) \mathrm{d}\left\|D^{s} u\right\|(x)+\delta \geqslant \lim _{j \rightarrow \infty} \int_{\Omega} g\left(\nabla u_{j}(x)\right) \mathrm{d} x .
$$

We now prove Theorem 1.1.
Proof of Theorem 1.1. By Theorem 3.1 and Remark 3.8, we have that (1.6) holds.
We observe that in view of $(\mathcal{F} 1)-(\mathcal{F} 4)$, we have that both $f_{\mathrm{hom}_{2}}$ and $f_{\text {hom }}$ are real-valued Borel functions, satisfying $(\mathcal{F} 1)-(\mathcal{F} 4)$, and we can find a constant $M>0$ such that for all $y_{1}, y_{2} \in \mathbb{R}^{N}, \xi \in \mathbb{R}^{d \times N}$,

$$
\begin{equation*}
\left|f\left(y_{1}, y_{2}, \xi\right)\right| \leqslant M(1+|\xi|), \quad\left|f_{\mathrm{hom}_{2}}\left(y_{1}, \xi\right)\right| \leqslant M(1+|\xi|), \quad\left|f_{\mathrm{hom}}(\xi)\right| \leqslant M(1+|\xi|) \tag{3.55}
\end{equation*}
$$

Moreover, since $(\mathcal{F} 4)$ holds for $f_{\text {hom }}$,

$$
\begin{equation*}
\liminf _{|\xi| \rightarrow \infty} \frac{f_{\mathrm{hom}}(\xi)}{|\xi|} \geqslant 0 \tag{3.56}
\end{equation*}
$$

The first equality in (1.7) is given by Theorem 3.7 (see also Remark 3.8). To prove the second equality in (1.7) we will proceed in several steps.

Step 1. We show that for all $u \in B V\left(\Omega ; \mathbb{R}^{d}\right)$,

$$
\begin{equation*}
\inf _{\substack{\mu_{1} \in \mathcal{M}_{\star}\left(\Omega: B V_{\#}\left(Y_{1} ; \mathbb{R}^{d}\right)\right) \\ \mu_{2} \in \mathcal{M}_{\star}\left(\Omega \times Y_{1} ; B V_{\#}\left(Y_{2} ; \mathbb{R}^{d}\right)\right)}} F^{\mathrm{sc}}\left(u, \boldsymbol{\mu}_{1}, \boldsymbol{\mu}_{2}\right) \geqslant \int_{\Omega} f_{\mathrm{hom}}(\nabla u(x)) \mathrm{d} x+\int_{\Omega}\left(f_{\mathrm{hom}}\right)^{\infty}\left(\frac{\mathrm{d} D^{s} u}{\mathrm{~d}\left\|D^{s} u\right\|}(x)\right) \mathrm{d}\left\|D^{s} u\right\|(x) . \tag{3.57}
\end{equation*}
$$

Fix $\left(u, \boldsymbol{\mu}_{1}, \boldsymbol{\mu}_{2}\right) \in B V\left(\Omega ; \mathbb{R}^{d}\right) \times \mathcal{M}_{\star}\left(\Omega ; B V_{\#}\left(Y_{1} ; \mathbb{R}^{d}\right)\right) \times \mathcal{M}_{\star}\left(\Omega \times Y_{1} ; B V_{\#}\left(Y_{2} ; \mathbb{R}^{d}\right)\right)$, and let $\left\{u_{j}\right\}_{j \in \mathbb{N}} \subset$ $C^{\infty}\left(\bar{\Omega} ; \mathbb{R}^{d}\right),\left\{\psi_{j}^{(1)}\right\}_{j \in \mathbb{N}} \subset C_{c}^{\infty}\left(\Omega ; C_{\#}^{\infty}\left(Y_{1} ; \mathbb{R}^{d}\right)\right)$ and $\left\{\psi_{j}^{(2)}\right\}_{j \in \mathbb{N}} \subset C_{c}^{\infty}\left(\Omega ; C_{\#}^{\infty}\left(Y_{1} \times Y_{2} ; \mathbb{R}^{d}\right)\right)$ be sequences given by Proposition 2.6.

By (1.6), applying Lemma 3.5 to $U:=\Omega \times Y_{1} \times Y_{2}$ and $g\left(x, y_{1}, y_{2}, \xi\right):=f\left(y_{1}, y_{2}, \xi\right)$ (see also Remark 1.3 (ii)),
and using the definitions of $f_{\text {hom }_{2}}$ and $f_{\text {hom }}$ together with Fubini's Theorem, we conclude that

$$
\begin{aligned}
F^{\mathrm{sc}}\left(u, \boldsymbol{\mu}_{1}, \boldsymbol{\mu}_{2}\right)= & \int_{\Omega \times Y_{1} \times Y_{2}} f\left(y_{1}, y_{2}, \frac{\mathrm{~d} \lambda_{u, \mu_{1}, \boldsymbol{\mu}_{2}}^{a c}}{\mathrm{~d} \mathcal{L}^{3 N}}\left(x, y_{1}, y_{2}\right)\right) \mathrm{d} x \mathrm{~d} y_{1} \mathrm{~d} y_{2} \\
& +\int_{\Omega \times Y_{1} \times Y_{2}} f^{\infty}\left(y_{1}, y_{2}, \frac{\mathrm{~d} \lambda_{u, \mu_{1}, \boldsymbol{\mu}_{2}}^{s}}{\mathrm{~d}\left\|\lambda_{u, \mu_{1}, \boldsymbol{\mu}_{2}}^{s}\right\|}\left(x, y_{1}, y_{2}\right)\right) \mathrm{d}\left\|\lambda_{u, \mu_{1}, \mu_{2}}^{s}\right\|\left(x, y_{1}, y_{2}\right) \\
= & \lim _{j \rightarrow \infty} \int_{\Omega \times Y_{1} \times Y_{2}} f\left(y_{1}, y_{2}, \nabla u_{j}(x)+\left(\nabla_{y_{1}} \psi_{j}^{(1)}\right)\left(x, y_{1}\right)+\left(\nabla_{y_{2}} \psi_{j}^{(2)}\right)\left(x, y_{1}, y_{2}\right)\right) \mathrm{d} x \mathrm{~d} y_{1} \mathrm{~d} y_{2} \\
\geqslant & \liminf _{j \rightarrow \infty} \int_{\Omega \times Y_{1}} f_{\text {hom }}\left(y_{1}, \nabla u_{j}(x)+\left(\nabla_{y_{1}} \psi_{j}^{(1)}\right)\left(x, y_{1}\right)\right) \mathrm{d} x \mathrm{~d} y_{1} \\
\geqslant & \liminf _{j \rightarrow \infty} \int_{\Omega} f_{\text {hom }}\left(\nabla u_{j}(x)\right) \mathrm{d} x \\
\geqslant & \int_{\Omega} f_{\text {hom }}(\nabla u(x)) \mathrm{d} x+\int_{\Omega}\left(f_{\text {hom }}\right)^{\infty}\left(\frac{\mathrm{d} D^{s} u}{\mathrm{~d}\left\|D^{s} u\right\|}(x)\right) \mathrm{d}\left\|D^{s} u\right\|(x),
\end{aligned}
$$

where in the last inequality we have used [37, Thm. 5.21] (see also Remark 1.3 (i)) taking into account that $\nabla u_{j} \mathcal{L}^{N}{ }_{\lfloor\Omega}$ 夫 $D u$ weakly- $\star$ in $\mathcal{M}\left(\Omega ; \mathbb{R}^{d \times N}\right)$ as $j \rightarrow \infty$, and that $f_{\text {hom }}$ is a real-valued convex function satisfying (3.56). Taking the infimum over all $\mu_{1} \in \mathcal{M}_{\star}\left(\Omega ; B V_{\#}\left(Y_{1} ; \mathbb{R}^{d}\right)\right)$ and $\mu_{2} \in \mathcal{M}_{\star}(\Omega \times$ $Y_{1} ; B V_{\#}\left(Y_{2} ; \mathbb{R}^{d}\right)$ ), we obtain (3.57).
Step 2. We prove that for all $u \in W^{1,1}\left(\Omega ; \mathbb{R}^{d}\right)$,

$$
\begin{equation*}
\inf _{\substack{\mu_{1} \in \mathcal{M}_{\star}\left(\Omega ; B V_{\#}\left(Y_{1} ; \mathbb{R}^{d}\right) \\ \mu_{2} \in \mathcal{M}_{*}\left(\Omega \times Y_{1} ; B V_{\#} ; Y_{2} ; \mathbb{R}^{(d)}\right)\right.}} F^{\mathrm{sc}}\left(u, \boldsymbol{\mu}_{1}, \boldsymbol{\mu}_{2}\right) \leqslant \int_{\Omega} f_{\text {hom }}(\nabla u(x)) \mathrm{d} x . \tag{3.58}
\end{equation*}
$$

Fix $\eta>0$, and let $0<\tau<\eta$ be such that for all measurable sets $D \subset \Omega$ with $\mathcal{L}^{N}(D) \leqslant \tau$,

$$
\begin{equation*}
\int_{D}(1+|\nabla u(x)|) \mathrm{d} x \leqslant \eta . \tag{3.59}
\end{equation*}
$$

In view of (2.35), without loss of generality we may assume that for all $x \in \Omega$,

$$
\begin{equation*}
f_{\text {hom }}(\nabla u(x)) \in \mathbb{R} . \tag{3.6}
\end{equation*}
$$

Fix $0<\delta<\tau$, and consider the multifunction $\Gamma_{1}^{\delta}: \Omega \rightarrow 2^{W_{\#}^{1,1}\left(Y_{1} ; \mathbb{R}^{d}\right)}$ defined, for each $x \in \Omega$, by

$$
\Gamma_{1}^{\delta}(x):=\left\{\psi_{1} \in W_{\#}^{1,1}\left(Y_{1} ; \mathbb{R}^{d}\right): \int_{Y_{1}} f_{\mathrm{hom}_{2}}\left(y_{1}, \nabla u(x)+\nabla \psi_{1}\left(y_{1}\right)\right) \mathrm{d} y_{1}<f_{\mathrm{hom}}(\nabla u(x))+\delta\right\}
$$

By (3.60), for all $x \in \Omega$ one has $\Gamma_{1}^{\delta}(x) \neq \emptyset$. Moreover, if $\left\{\psi_{j}\right\}_{j \in \mathbb{N}} \subset W_{\#}^{1,1}\left(Y_{1} ; \mathbb{R}^{d}\right) \backslash \Gamma_{1}^{\delta}(x)$ is a sequence converging in $W_{\#}^{1,1}\left(Y_{1} ; \mathbb{R}^{d}\right)$ to some $\psi$, then, taking into account (2.35) and the continuity of $f_{\text {hom }_{2}}\left(y_{1}, \cdot\right)$, by Lebesgue Dominated Convergence Theorem we deduce that $\psi \in W_{\#}^{1,1}\left(Y_{1} ; \mathbb{R}^{d}\right) \backslash \Gamma_{1}^{\delta}(x)$. Thus, $\Gamma_{1}^{\delta}(x)$ is an open subset of $W_{\#}^{1,1}\left(Y_{1} ; \mathbb{R}^{d}\right)$. Furthermore, given $\psi_{1} \in W_{\#}^{1,1}\left(Y_{1} ; \mathbb{R}^{d}\right)$, the measurability of the function

$$
x \mapsto \int_{Y_{1}} f_{\mathrm{hom}_{2}}\left(y_{1}, \nabla u(x)+\nabla \psi_{1}\left(y_{1}\right)\right) \mathrm{d} y_{1}-f_{\text {hom }}(\nabla u(x))-\delta
$$

ensures the measurability of the set $\left\{x \in \Omega: \psi_{1} \in \Gamma_{1}^{\delta}(x)\right\}$. Thus, by Lemma 3.9 we can find a measurable selection $\bar{\psi}_{1}: \Omega \rightarrow W_{\#}^{1,1}\left(Y_{1} ; \mathbb{R}^{d}\right)$ of $\Gamma_{1}^{\delta}$. Moreover, by Lusin's Theorem, $\bar{\psi}_{1} \in L^{1}\left(\Omega_{\delta} ; W_{\#}^{1,1}\left(Y_{1} ; \mathbb{R}^{d}\right)\right)$ for a
suitable measurable set $\Omega_{\delta} \subset \Omega$ such that $\mathcal{L}^{N}\left(\Omega \backslash \Omega_{\delta}\right) \leqslant \delta$. Since for a.e. $x \in \Omega_{\delta}$ one has $\bar{\psi}_{1}(x) \in \Gamma_{1}^{\delta}(x)$, in view of (2.35) and (3.59) we obtain

$$
\begin{equation*}
\int_{\Omega_{\delta} \times Y_{1}} f_{\mathrm{hom}_{2}}\left(y_{1}, \nabla u(x)+\nabla_{y_{1}} \bar{\psi}_{1}\left(x, y_{1}\right)\right) \mathrm{d} x \mathrm{~d} y_{1} \leqslant \int_{\Omega} f_{\mathrm{hom}}(\nabla u(x)) \mathrm{d} x+M \eta+\eta \mathcal{L}^{N}(\Omega) \tag{3.61}
\end{equation*}
$$

where we also used the fact that $0<\delta<\tau<\eta$.
Similarly, let $0<\bar{\tau}<\delta$ be such that for all measurable sets $E \subset \Omega_{\delta} \times Y$ with $\mathcal{L}^{2 N}(E) \leqslant \bar{\tau}$,

$$
\begin{equation*}
\int_{E}\left(1+\left|\nabla u(x)+\nabla_{y_{1}} \bar{\psi}_{1}\left(x, y_{1}\right)\right|\right) \mathrm{d} x \mathrm{~d} y_{1} \leqslant \eta . \tag{3.62}
\end{equation*}
$$

As before, we may assume without loss of generality that for all $\left(x, y_{1}\right) \in \Omega_{\delta} \times Y_{1}$ we have $f_{\text {hom }_{2}}\left(y_{1}, \nabla u(x)+\right.$ $\left.\nabla_{y_{1}} \bar{\psi}_{1}\left(x, y_{1}\right)\right) \in \mathbb{R}$. Moreover, fixed $0<\gamma<\bar{\tau}$, the multifunction $\Gamma_{2}^{\gamma}: \Omega_{\delta} \times Y_{1} \rightarrow 2^{W_{\#}^{1,1}\left(Y_{2} ; \mathbb{R}^{d}\right)}$ defined, for each $\left(x, y_{1}\right) \in \Omega_{\delta} \times Y_{1}$, by

$$
\begin{aligned}
\Gamma_{2}^{\gamma}\left(x, y_{1}\right):=\left\{\psi_{2} \in W_{\#}^{1,1}\left(Y_{2} ; \mathbb{R}^{d}\right): \int_{Y_{2}} f\left(y_{1}, y_{2}, \nabla u(x)\right.\right. & \left.+\nabla_{y_{1}} \bar{\psi}_{1}\left(x, y_{1}\right)+\nabla \psi_{2}\left(y_{2}\right)\right) \mathrm{d} y_{2} \\
& \left.<f_{\mathrm{hom}_{2}}\left(y_{1}, \nabla u(x)+\nabla_{y_{1}} \bar{\psi}_{1}\left(x, y_{1}\right)\right)+\gamma\right\}
\end{aligned}
$$

is such that for all $\left(x, y_{1}\right) \in \Omega_{\delta} \times Y_{1}, \Gamma_{2}^{\gamma}\left(x, y_{1}\right)$ is a nonempty and open subset of $W_{\#}^{1,1}\left(Y_{2} ; \mathbb{R}^{d}\right)$, and for all $\psi_{2} \in W_{\#}^{1,1}\left(Y_{2} ; \mathbb{R}^{d}\right)$, the set $\left\{\left(x, y_{1}\right) \in \Omega_{\delta} \times Y_{1}: \psi_{2} \in \Gamma_{2}^{\gamma}\left(x, y_{1}\right)\right\}$ is measurable. Hence, by Lemma 3.9 we can find a measurable selection $\bar{\psi}_{2}: \Omega_{\delta} \times Y_{1} \rightarrow W_{\#}^{1,1}\left(Y_{2} ; \mathbb{R}^{d}\right)$ of $\Gamma_{2}^{\gamma}$. Moreover, by Lusin's Theorem, $\bar{\psi}_{2} \in L^{1}\left(E_{\gamma} ; W_{\#}^{1,1}\left(Y_{2} ; \mathbb{R}^{d}\right)\right)$ for a suitable measurable set $E_{\gamma} \subset \Omega_{\delta} \times Y_{1}$ such that $\mathcal{L}^{N}\left(\Omega_{\delta} \times Y_{1} \backslash E_{\gamma}\right) \leqslant \gamma$. Since for a.e. $\left(x, y_{1}\right) \in E_{\gamma}$ one has $\bar{\psi}_{2}\left(x, y_{1}\right) \in \Gamma_{2}^{\gamma}\left(x, y_{1}\right)$, in view of (2.35) and (3.62) we get

$$
\begin{align*}
& \int_{E_{\gamma} \times Y_{2}} f\left(y_{1}, y_{2}, \nabla u(x)+\nabla_{y_{1}} \bar{\psi}_{1}\left(x, y_{1}\right)+\nabla_{y_{2}} \bar{\psi}_{2}\left(x, y_{1} y_{2}\right)\right) \mathrm{d} x \mathrm{~d} y_{1} \mathrm{~d} y_{2}  \tag{3.63}\\
& \leqslant \int_{\Omega_{\delta} \times Y_{1}} f_{\mathrm{hom}_{2}}\left(y_{1}, \nabla u(x)+\nabla_{y_{1}} \bar{\psi}_{1}\left(x, y_{1}\right)\right) \mathrm{d} x \mathrm{~d} y_{1}+M \eta+\eta \mathcal{L}^{N}(\Omega) .
\end{align*}
$$

Finally, define $\psi_{1} \in L^{1}\left(\Omega ; W_{\#}^{1,1}\left(Y_{1} ; \mathbb{R}^{d}\right)\right), \psi_{2} \in L^{1}\left(\Omega \times Y_{1} ; W_{\#}^{1,1}\left(Y_{2} ; \mathbb{R}^{d}\right)\right)$ by setting $\psi_{1}(x):=\bar{\psi}_{1}(x)$ if $x \in \Omega_{\delta}$, $\psi_{1}(x):=0$ if $x \in \Omega \backslash \Omega_{\delta}, \psi_{2}\left(x, y_{1}\right):=\bar{\psi}_{2}\left(x, y_{1}\right)$ if $\left(x, y_{1}\right) \in E_{\gamma}$, and $\psi_{2}\left(x, y_{1}\right):=0$ if $\left(x, y_{1}\right) \in\left(\Omega \times Y_{1}\right) \backslash E_{\gamma}$. Using the usual identification of an integrable function with a measure, elements of $L^{1}\left(\Omega ; W_{\#}^{1,1}\left(Y_{1} ; \mathbb{R}^{d}\right)\right)$ and $L^{1}\left(\Omega \times Y_{1} ; W_{\#}^{1,1}\left(Y_{2} ; \mathbb{R}^{d}\right)\right)$ can be seen as elements of $\mathcal{M}_{\star}\left(\Omega ; B V_{\#}\left(Y_{1} ; \mathbb{R}^{d}\right)\right)$ and $\mathcal{M}_{\star}\left(\Omega \times Y_{1} ; B V_{\#}\left(Y_{2} ; \mathbb{R}^{d}\right)\right)$, respectively. Considering this identification (see also (2.1)), we have

$$
\begin{equation*}
\lambda_{u, \psi_{1}, \psi_{2}\left\lfloor\Omega \times Y_{1} \times Y_{2}\right.}=\nabla u \mathcal{L}_{\left\lfloor\Omega \times Y_{1} \times Y_{2}\right.}^{3 N}+\nabla_{y_{1}} \psi_{1} \mathcal{L}_{\left\lfloor\Omega \times Y_{1} \times Y_{2}\right.}^{3 N}+\nabla_{y_{2}} \psi_{2} \mathcal{L}_{\left\lfloor\Omega \times Y_{1} \times Y_{2}\right.}^{3 N} \tag{3.64}
\end{equation*}
$$

From (1.6), (3.64), (2.35), (3.59), (3.62), (3.63) and (3.61), in this order, we deduce that

$$
\begin{aligned}
& \inf _{\substack{\mu_{1} \in \mathcal{M}_{\star}\left(\Omega, B V \neq V_{\#}\left(Y_{1} ; \mathbb{R}^{d}\right) \\
\mu_{2} \in \mathcal{M}_{*}\left(\Omega \times Y_{1} ; B V_{\#}\left(Y_{2} ; \mathbb{R}^{d} d\right)\right.\right.}} F^{\mathrm{sc}}\left(u, \boldsymbol{\mu}_{1}, \boldsymbol{\mu}_{2}\right) \\
& =\inf _{\substack{\mu_{1} \in \mathcal{M}_{ \pm}\left(\Omega ; F V_{\#}\left(Y_{1} ; \mathbb{R}^{d}\right) \\
\mu_{2} \in \mathcal{M}_{+}\left(\Omega \times Y_{1} ; B V \neq \# \\
Y_{2} ; \mathbb{R}^{d}()\right)\right.}}\left\{\int_{\Omega \times Y_{1} \times Y_{2}} f\left(y_{1}, y_{2}, \frac{\mathrm{~d} \lambda_{u, \mu_{1}}^{a c}, \mu_{2}}{\mathrm{~d} \mathcal{L}^{3 N}}\left(x, y_{1}, y_{2}\right)\right) \mathrm{d} x \mathrm{~d} y_{1} \mathrm{~d} y_{2}\right. \\
& \left.+\int_{\Omega \times Y_{1} \times Y_{2}} f^{\infty}\left(y_{1}, y_{2}, \frac{\mathrm{~d} \lambda_{u, \boldsymbol{\mu}_{1}, \boldsymbol{\mu}_{2}}^{s}}{\mathrm{~d}\left\|\lambda_{u, \boldsymbol{\mu}_{1}, \boldsymbol{\mu}_{2}}\right\|}\left(x, y_{1}, y_{2}\right)\right) \mathrm{d}\left\|\lambda_{u, \boldsymbol{\mu}_{1}, \boldsymbol{\mu}_{2}}^{s}\right\|\left(x, y_{1}, y_{2}\right)\right\} \\
& \leqslant \int_{\Omega \times Y_{1} \times Y_{2}} f\left(y_{1}, y_{2}, \nabla u(x)+\nabla_{y_{1}} \psi_{1}\left(x, y_{1}\right)+\nabla_{y_{2}} \psi_{2}\left(x, y_{1}, y_{2}\right)\right) \mathrm{d} x \mathrm{~d} y_{1} \mathrm{~d} y_{2} \\
& =\int_{\left(\Omega \backslash \Omega_{\delta}\right) \times Y_{1} \times Y_{2}} f\left(y_{1}, y_{2}, \nabla u(x)\right) \mathrm{d} x \mathrm{~d} y_{1} \mathrm{~d} y_{2} \\
& +\int_{\left(\left(\Omega_{5} \times Y_{1}\right) \backslash E_{\gamma}\right) \times Y_{2}} f\left(y_{1}, y_{2}, \nabla u(x)+\nabla_{y_{1}} \bar{\psi}_{1}\left(x, y_{1}\right)\right) \mathrm{d} x \mathrm{~d} y_{1} \mathrm{~d} y_{2} \\
& +\int_{E_{\gamma} \times Y_{2}} f\left(y_{1}, y_{2}, \nabla u(x)+\nabla_{y_{1}} \bar{\psi}_{1}\left(x, y_{1}\right)+\nabla_{y_{2}} \bar{\psi}_{2}\left(x, y_{1} y_{2}\right)\right) \mathrm{d} x \mathrm{~d} y_{1} \mathrm{~d} y_{2} \\
& \leqslant 2 M \eta+\int_{\Omega} f_{\text {hom }}(\nabla u(x)) \mathrm{d} x+2\left(M \eta+\eta \mathcal{L}^{N}(\Omega)\right) .
\end{aligned}
$$

Letting $\eta \rightarrow 0^{+}$, we obtain (3.58).
Step 3. We prove that if ( $\mathcal{F} 4)^{\prime}$ is satisfied, then the converse of (3.57) holds for all $u \in B V\left(\Omega ; \mathbb{R}^{d}\right)$.
Indeed, let $u \in B V\left(\Omega ; \mathbb{R}^{d}\right)$. Since $f_{\text {hom }}: \mathbb{R}^{d \times N} \rightarrow \mathbb{R}$ is a convex function satisfying (2.35), in view of Lemma 3.10 for all $\eta>0$ we can find a sequence $\left\{u_{j}\right\}_{j \in \mathbb{N}} \subset W^{1,1}\left(\Omega ; \mathbb{R}^{d}\right)$ weakly-丸 converging to $u$ in $B V\left(\Omega ; \mathbb{R}^{d}\right)$ and such that

$$
\lim _{j \rightarrow \infty} \int_{\Omega} f_{\text {hom }}\left(\nabla u_{j}(x)\right) \mathrm{d} x \leqslant \int_{\Omega} f_{\text {hom }}(\nabla u(x)) \mathrm{d} x+\int_{\Omega}\left(f_{\text {hom }}\right)^{\infty}\left(\frac{\mathrm{d} D^{s} u}{\mathrm{~d}\left\|D^{s} u\right\|}(x)\right) \mathrm{d}\left\|D^{s} u\right\|(x)+\eta
$$

Under the present hypotheses on $f$, it can be checked that $F^{\text {hom }}$ is sequentially lower semicontinuous with respect to the weak-ᄎ convergence in $B V\left(\Omega ; \mathbb{R}^{d}\right)$. Hence, using Theorem 3.7 and (3.58),

$$
\begin{aligned}
& \inf _{\substack{\mu_{1} \in \mathcal{M}_{\star}\left(\Omega, B V_{\#}\left(Y_{1} ; \mathbb{R}^{d}\right)\right) \\
\mu_{2} \in \mathcal{M}_{\star}\left(\Omega \times Y_{1} ; B V_{\#}\left(Y_{2} ; \mathbb{R}^{d}\right)\right)}} F^{\mathrm{sc}}\left(u, \boldsymbol{\mu}_{1}, \boldsymbol{\mu}_{2}\right) \leqslant \liminf _{j \rightarrow \infty} \inf _{\substack{\mu_{1} \in \mathcal{M}_{\star}\left(\Omega ; ; V_{\#}\left(Y_{1} ; \mathbb{R}^{d}\right)\right) \\
\mu_{2} \in \mathcal{M}_{\star}\left(\Omega \times\left(\Omega \times Y_{1} ; B V_{\#}\left(Y_{2} ; \mathbb{R}^{d}\right)\right)\right.}} F^{\mathrm{sc}}\left(u_{j}, \boldsymbol{\mu}_{1}, \boldsymbol{\mu}_{2}\right) \\
& \leqslant \lim _{j \rightarrow \infty} \int_{\Omega} f_{\text {hom }}\left(\nabla u_{j}(x)\right) \mathrm{d} x \leqslant \int_{\Omega} f_{\text {hom }}(\nabla u(x)) \mathrm{d} x+\int_{\Omega}\left(f_{\text {hom }}\right)^{\infty}\left(\frac{\mathrm{d} D^{s} u}{\mathrm{~d}\left\|D^{s} u\right\|}(x)\right) \mathrm{d}\left\|D^{s} u\right\|(x)+\eta,
\end{aligned}
$$

from which we conclude Step 3 by letting $\eta \rightarrow 0^{+}$.
Step 4. We establish the second equality in (1.7).
Let $u \in B V\left(\Omega ; \mathbb{R}^{d}\right)$, and fix $\eta>0$ (which, without loss of generality, we assume will take values on a sequence of positive numbers converging to zero). Then $f_{\eta}$ (we recall, $\left.f_{\eta}\left(y_{1}, y_{2}, \xi\right):=f\left(y_{1}, y_{2}, \xi\right)+\eta|\xi|\right)$ satisfies conditions $(\mathcal{F} 1)-(\mathcal{F} 3),(\mathcal{F} 4)^{\prime},(\mathcal{F} 5)$; condition $(\mathcal{F} 6)$, which was only used in Lemma 3.2, reads slightly different for $f_{\eta}$ than for $f$ (see (3.8)), but it can be checked that this difference is innocuous. So, in view of Steps 1, 2 and 3 applied to $f_{\eta}$,

$$
\begin{equation*}
\inf _{\substack{\mu_{1} \in \mathcal{M}_{\star}\left(\Omega ; B V_{\neq}\left(Y_{1} ; \mathbb{R}^{d}\right)\right) \\ \mu_{2} \in \mathcal{M}_{\star}\left(\Omega \times Y_{1} ; B V_{+}\left(Y_{2} ; \mathbb{R}^{d}\right)\right)}} F_{\eta}^{\mathrm{sc}}\left(u, \boldsymbol{\mu}_{1}, \boldsymbol{\mu}_{2}\right)=\int_{\Omega} f_{\eta, \text { hom }}(\nabla u(x)) \mathrm{d} x+\int_{\Omega}\left(f_{\eta, \text { hom }}\right)^{\infty}\left(\frac{\mathrm{d} D^{s} u}{\mathrm{~d}\left\|D^{s} u\right\|}(x)\right) \mathrm{d}\left\|D^{s} u\right\|(x), \tag{3.65}
\end{equation*}
$$

where $F_{\eta}^{\text {sc }}$ is the functional given by (3.44), and where $f_{\eta, \text { hom }}:=\left(f_{\eta}\right)_{\text {hom }}$.
In order to pass (3.65) to the limit as $\eta \rightarrow 0^{+}$, we start by observing that for fixed $\left(u, \boldsymbol{\mu}_{1}, \boldsymbol{\mu}_{2}\right) \in$ $B V\left(\Omega ; \mathbb{R}^{d}\right) \times \mathcal{M}_{\star}\left(\Omega ; B V_{\#}\left(Y_{1} ; \mathbb{R}^{d}\right)\right) \times \mathcal{M}_{\star}\left(\Omega \times Y_{1} ; B V_{\#}\left(Y_{2} ; \mathbb{R}^{d}\right)\right), \lambda_{u, \mu_{1}, \mu_{2}}$ has finite total variation and $\left\{F_{\eta}^{\text {sc }}\left(u, \boldsymbol{\mu}_{1}, \boldsymbol{\mu}_{2}\right)\right\}_{\eta>0}$ is a bounded decreasing sequence, and so

$$
\begin{align*}
& \lim _{\eta \rightarrow 0^{+}} \inf _{\substack{\mu_{1} \in \mathcal{M}_{\star}\left(\Omega ; B V_{\#}\left(Y_{1} ; \mathbb{R}^{d}\right)\right) \\
\mu_{2} \in \mathcal{M}_{\star}\left(\Omega \times Y_{1} ; B V_{\#}\left(Y_{2} ; \mathbb{R}^{d}\right)\right)}} F_{\eta}^{\mathrm{sc}}\left(u, \boldsymbol{\mu}_{1}, \boldsymbol{\mu}_{2}\right)=\inf _{\eta>0} \inf _{\substack{\mu_{1} \in \mathcal{M}_{\star}\left(\Omega ; B V_{\#}\left(Y_{1} ; \mathbb{R}^{d}\right)\right) \\
\mu_{2} \in \mathcal{M}_{\star}\left(\Omega \times Y_{1} ; B V_{\#}\left(Y_{2} ; \mathbb{R}^{d}\right)\right)}} F_{\eta}^{\mathrm{sc}}\left(u, \boldsymbol{\mu}_{1}, \boldsymbol{\mu}_{2}\right) \\
& \quad=\inf _{\substack{\mu_{1} \in \mathcal{M}_{\star}\left(\Omega ; B V_{\#}\left(Y_{1} ; \mathbb{R}^{d}\right)\right) \\
\mu_{2} \in \mathcal{M}_{\star}\left(\Omega \times Y_{1} ; B V_{\#}\left(Y_{2} ; \mathbb{R}^{d}\right)\right)}} \inf _{\eta>0} F_{\eta}^{\mathrm{sc}}\left(u, \boldsymbol{\mu}_{1}, \boldsymbol{\mu}_{2}\right)=  \tag{3.66}\\
& \inf _{\substack{\mu_{1} \in \mathcal{M}_{\star}\left(\Omega ; B V_{\#}\left(Y_{1} ; \mathbb{R}^{d}\right)\right) \\
\mu_{2} \in \mathcal{M}_{\star}\left(\Omega \times Y_{1} ; B V_{\#}\left(Y_{2} ; \mathbb{R}^{d}\right)\right)}} F^{\mathrm{sc}}\left(u, \boldsymbol{\mu}_{1}, \boldsymbol{\mu}_{2}\right) .
\end{align*}
$$

Furthermore, using Lebesgue Dominated Convergence Theorem together with (3.55), in view of (2.36) (observing that thanks to $(\mathcal{F} 2), f^{* *}=f$ and $\left.\left(f_{\eta}\right)^{* *}=f_{\eta}\right)$ and of (2.28) we get

$$
\begin{equation*}
\lim _{\eta \rightarrow 0^{+}} \int_{\Omega} f_{\eta, \text { hom }}(\nabla u(x)) \mathrm{d} x=\int_{\Omega} f_{\text {hom }}(\nabla u(x)) \mathrm{d} x \tag{3.67}
\end{equation*}
$$

and

$$
\begin{equation*}
\lim _{\eta \rightarrow 0^{+}} \int_{\Omega}\left(f_{\eta, \text { hom }}\right)^{\infty}\left(\frac{\mathrm{d} D^{s} u}{\mathrm{~d}\left\|D^{s} u\right\|}(x)\right) \mathrm{d}\left\|D^{s} u\right\|(x)=\int_{\Omega}\left(f_{0^{+}, \text {hom }}\right)^{\infty}\left(\frac{\mathrm{d} D^{s} u}{\mathrm{~d}\left\|D^{s} u\right\|}(x)\right) \mathrm{d}\left\|D^{s} u\right\|(x) . \tag{3.68}
\end{equation*}
$$

From (3.65), (3.66), (3.67) and (3.68), we conclude Step 4.
Finally, we observe that
a) if, in addition, $f$ satisfies $(\mathcal{F} 4)^{\prime}$, then by Step 1 -Step 4 , we have that $\left(f_{0^{+}, \text {hom }}\right)^{\infty} \equiv\left(f_{\text {hom }}\right)^{\infty}$;
b) if, in addition, $f$ satisfies $(\mathcal{F} 8)$, then by Proposition 2.9 (ii)-a), $\left(f_{0^{+}, \text {hom }}\right)^{\infty} \equiv\left(f_{\text {hom }}\right)^{\infty}=\left(f^{\infty}\right)_{\text {hom }}$;
c) if, in addition, $f$ satisfies $(\mathcal{F} 7)$, then Proposition 2.9 (ii)-b) yields $\left(f_{0^{+}, \text {hom }}\right)^{\infty} \equiv\left(f^{\infty}\right)_{\text {hom }}$.

## 4. Proof of Corollary 1.2

As in the previous section, below we will assume, without loss of generality, that $n=2$, since the generalization to an arbitrary $n \in \mathbb{N}$ does not bring any additional technical difficulties.

The proof of Corollary 1.2 relies on Theorems 1.1 and on the next lemma concerning properties inherited by $f^{* *}$ from $f$.

Lemma 4.1. Assume that $f: \mathbb{R}^{N} \times \mathbb{R}^{N} \times \mathbb{R}^{N} \rightarrow \mathbb{R}$ is a function satisfying conditions $(\mathcal{F} 1)$, $(\mathcal{F} 3)$, $(\mathcal{F} 4)^{\prime}$,, $(\mathcal{F} 5)$ and $(\mathcal{F} 6)$ with $d=1$. Then the biconjugate function $f^{* *}$ of $f$ is a real-valued Borel function in $\mathbb{R}^{N} \times \mathbb{R}^{N} \times \mathbb{R}^{N}$, and verifies conditions $(\mathcal{F} 1),(\mathcal{F} 3),(\mathcal{F} 4)^{\prime},(\mathcal{F} 5)$ and $(\mathcal{F} 6)$ with $d=1$.
Proof. By (2.29) and since $f_{1} \leqslant f_{2}$ implies that $\mathcal{C} f_{1} \leqslant \mathcal{C} f_{2}$, the only nontrivial condition to verify is $(\mathcal{F} 5)$. Fix $\left(y_{1}^{\prime}, y_{2}^{\prime}\right) \in \mathbb{R}^{N} \times \mathbb{R}^{N}$ and $\delta>0$ arbitrarily. Set $\bar{\delta}:=\delta /\left(1+2 C^{2}\right)$, where $C$ is given by $(\mathcal{F} 3)$ and $(\mathcal{F} 4)^{\prime}$, and let $\bar{\tau}=\bar{\tau}\left(y_{1}^{\prime}, y_{2}^{\prime}, \bar{\delta}\right)$ be given by $(\mathcal{F} 5)$ for $f$ and for such $\bar{\delta}$.
Fix $\xi \in \mathbb{R}^{N}$ and $\left(y_{1}, y_{2}\right) \in \mathbb{R}^{N} \times \mathbb{R}^{N}$ such that $\left|\left(y_{1}^{\prime}, y_{2}^{\prime}\right)-\left(y_{1}, y_{2}\right)\right| \leqslant \bar{\tau}$. By (2.33), for each $\epsilon>0$ we can find $\varphi_{\epsilon} \in W_{0}^{1, \infty}(Y)$ such that

$$
\begin{equation*}
\int_{Y} f\left(y_{1}, y_{2}, \xi+\nabla \varphi_{\epsilon}(y)\right) \mathrm{d} y \leqslant f^{* *}\left(y_{1}, y_{2}, \xi\right)+\epsilon \tag{4.1}
\end{equation*}
$$

and so,

$$
\begin{align*}
f^{* *}\left(y_{1}^{\prime}, y_{2}^{\prime}, \xi\right)-f^{* *}\left(y_{1}, y_{2}, \xi\right) & \leqslant \int_{Y}\left(f\left(y_{1}^{\prime}, y_{2}^{\prime}, \xi+\nabla \varphi_{\epsilon}(y)\right)-f\left(y_{1}, y_{2}, \xi+\nabla \varphi_{\epsilon}(y)\right)\right) \mathrm{d} y+\epsilon  \tag{4.2}\\
& \leqslant \int_{Y} \bar{\delta}\left(1+\left|\xi+\nabla \varphi_{\epsilon}(y)\right|\right) \mathrm{d} y+\epsilon
\end{align*}
$$

where in the last inequality we used $(\mathcal{F} 5)$ for $f$.
In view of $(4.1),(\mathcal{F} 3)$ and $(\mathcal{F} 4)^{\prime}$, we have that $\frac{1}{C}\left\|\xi+\nabla \varphi_{\epsilon}\right\|_{L^{1}\left(Y ; \mathbb{R}^{N}\right)}-C \leqslant C(1+|\xi|)+\epsilon$. Thus, from (4.2) we deduce that

$$
f^{* *}\left(y_{1}^{\prime}, y_{2}^{\prime}, \xi\right)-f^{* *}\left(y_{1}, y_{2}, \xi\right) \leqslant \bar{\delta}\left(1+C^{2}(2+|\xi|)\right)+(\bar{\delta} C+1) \epsilon \leqslant \delta(1+|\xi|)+(\delta C+1) \epsilon
$$

Letting $\epsilon \rightarrow 0^{+}$, we conclude that

$$
f^{* *}\left(y_{1}^{\prime}, y_{2}^{\prime}, \xi\right)-f^{* *}\left(y_{1}, y_{2}, \xi\right) \leqslant \delta(1+|\xi|) .
$$

Interchanging the roles between $\left(y_{1}^{\prime}, y_{2}^{\prime}, \xi\right)$ and $\left(y_{1}, y_{2}, \xi\right)$, we prove that $f^{* *}\left(y_{1}, y_{2}, \xi\right)-f^{* *}\left(y_{1}^{\prime}, y_{2}^{\prime}, \xi\right) \leqslant \delta(1+$ $|\xi|)$ also holds. Thus $f^{* *}$ satisfies $(\mathcal{F} 5)$.

Proof of Corollary 1.2. We proceed in two steps.
Step 1. We prove that if in addition $f$ satisfies $(\mathcal{F} 4)^{\prime}$, then $(1.9)$ holds with $\left(f_{0^{+}}^{* *}\right)^{\infty}$ replaced by $\left(f^{* *}\right)^{\infty}$, and (1.10) holds with $\left(\left(\left(f_{0^{+}}\right)^{* *}\right)_{\text {hom }}\right)^{\infty}$ replaced by $\left(\left(f^{* *}\right)_{\text {hom }}\right)^{\infty}$.

Substep 1.1. We show that the infima (1.4) and (1.5) remain unchanged if we substitute $f$ by its biconjugate function $f^{* *}$.
Fix $\left(u, \boldsymbol{\mu}_{1}, \boldsymbol{\mu}_{2}\right) \in B V(\Omega) \times \mathcal{M}_{\star}\left(\Omega ; B V_{\#}\left(Y_{1}\right)\right) \times \mathcal{M}_{\star}\left(\Omega \times Y_{1} ; B V_{\#}\left(Y_{2}\right)\right)$, and define

$$
F^{* *, \mathrm{sc}}\left(u, \boldsymbol{\mu}_{1}, \boldsymbol{\mu}_{2}\right):=\inf \left\{\liminf _{\varepsilon \rightarrow 0^{+}} F_{\varepsilon}^{* *}\left(u_{\varepsilon}\right): u_{\varepsilon} \in B V(\Omega), D u_{\varepsilon} \frac{3-s c}{\varepsilon} \lambda_{u, \mu_{1}, \mu_{2}}\right\}
$$

and

$$
F^{* *, h o m}(u):=\inf \left\{\liminf _{\varepsilon \rightarrow 0^{+}} F_{\varepsilon}^{* *}\left(u_{\varepsilon}\right): u_{\varepsilon} \in B V(\Omega), u_{\varepsilon} \stackrel{\rightharpoonup}{\star}_{\varepsilon} u \text { weakly-丸 in } B V(\Omega)\right\},
$$

where $F_{\varepsilon}^{* *}$ is the functional given by (3.1) for $d=1$ and with $f$ replaced by $f^{* *}$.
Notice that by Lemma 4.1 and Remark 1.3 (ii), $f^{* *}$ is a real-valued continuous function in $\mathbb{R}^{N} \times \mathbb{R}^{N} \times \mathbb{R}^{N}$ satisfying conditions $(\mathcal{F} 1),(\mathcal{F} 3),(\mathcal{F} 4)^{\prime},(\mathcal{F} 5)$ and $(\mathcal{F} 6)$ with $d=1$.

Since $f^{* *} \leqslant f$, we have that $F^{* *, \text { sc }}\left(u, \boldsymbol{\mu}_{1}, \boldsymbol{\mu}_{2}\right) \leqslant F^{\mathrm{sc}}\left(u, \boldsymbol{\mu}_{1}, \boldsymbol{\mu}_{2}\right)$ and $F^{* *, \text { hom }}(u) \leqslant F^{\text {hom }}(u)$. To prove the opposite inequalities, we start by observing that in view of (3.38)-(3.42) the following equalities hold:

$$
\begin{aligned}
F^{* *, \mathrm{sc}}\left(u, \boldsymbol{\mu}_{1}, \boldsymbol{\mu}_{2}\right) & =\inf \left\{\liminf _{\varepsilon \rightarrow 0^{+}} F_{\varepsilon}^{* *}\left(u_{\varepsilon}\right): u_{\varepsilon} \in W^{1,1}(\Omega), \nabla u_{\varepsilon} \mathcal{L}^{N}{ }_{\lfloor\Omega} \frac{3-s c}{\varepsilon} \lambda_{u, \boldsymbol{\mu}_{1}, \boldsymbol{\mu}_{2}}\right\} \\
& =\inf \left\{\liminf _{\varepsilon \rightarrow 0^{+}} \int_{\Omega} f^{* *}\left(\frac{x}{\varrho_{1}(\varepsilon)}, \frac{x}{\varrho_{2}(\varepsilon)}, \nabla u_{\varepsilon}(x)\right) \mathrm{d} x: u_{\varepsilon} \in W^{1,1}(\Omega), \nabla u_{\varepsilon} \mathcal{L}^{N}{ }_{\lfloor\Omega} \frac{3-s c}{\varepsilon} \lambda_{u, \mu_{1}, \boldsymbol{\mu}_{2}}\right\} .
\end{aligned}
$$

Moreover, a similar argument to (3.38)-(3.42) ensures that also

$$
\begin{aligned}
F^{* *, \operatorname{hom}}(u) & =\inf \left\{\liminf _{\varepsilon \rightarrow 0^{+}} F_{\varepsilon}^{* *}\left(u_{\varepsilon}\right): u_{\varepsilon} \in W^{1,1}(\Omega), u_{\varepsilon} \stackrel{\star}{\varepsilon}_{\varepsilon} u \text { weakly-ぇ in } B V(\Omega)\right\} \\
& =\inf \left\{\liminf _{\varepsilon \rightarrow 0^{+}} \int_{\Omega} f^{* *}\left(\frac{x}{\varrho_{1}(\varepsilon)}, \frac{x}{\varrho_{2}(\varepsilon)}, \nabla u_{\varepsilon}(x)\right) \mathrm{d} x: u_{\varepsilon} \in W^{1,1}(\Omega), u_{\varepsilon} \stackrel{\star}{\varepsilon} u \text { weakly-* in } B V(\Omega)\right\} .
\end{aligned}
$$

Fix $\delta>0$. We can find a sequence $\left\{\varepsilon_{h}\right\}_{h \in \mathbb{N}}$ of positive numbers converging to zero as $h \rightarrow \infty$, and a sequence $\left\{u_{h}\right\}_{h \in \mathbb{N}} \subset W^{1,1}(\Omega)$ such that $\nabla u_{h} \mathcal{L}^{N}{ }_{\lfloor\Omega} \frac{3-s c}{\varepsilon_{h}} \lambda_{u, \mu_{1}, \boldsymbol{\mu}_{2}}$ and

$$
F^{* *, \mathrm{sc}}\left(u, \boldsymbol{\mu}_{1}, \boldsymbol{\mu}_{2}\right)+\delta \geqslant \lim _{h \rightarrow \infty} \int_{\Omega} f^{* *}\left(\frac{x}{\varrho_{1}\left(\varepsilon_{h}\right)}, \frac{x}{\varrho_{2}\left(\varepsilon_{h}\right)}, \nabla u_{h}(x)\right) \mathrm{d} x
$$

On the other hand (see, for example, [41, Cor. 3.13]; see also [33, Chapter X]), since $f$ is a continuous function satisfying $(\mathcal{F} 3)$ and $(\mathcal{F} 4)^{\prime}$, for each $h \in \mathbb{N}$ there exist a sequence $\left\{u_{j}^{(h)}\right\}_{j \in \mathbb{N}} \subset W^{1,1}(\Omega)$ weakly converging to $u_{h}$ in $W^{1,1}(\Omega)$ and such that

$$
\int_{\Omega} f^{* *}\left(\frac{x}{\varrho_{1}\left(\varepsilon_{h}\right)}, \frac{x}{\varrho_{2}\left(\varepsilon_{h}\right)}, \nabla u_{h}(x)\right) \mathrm{d} x=\lim _{j \rightarrow \infty} \int_{\Omega} f\left(\frac{x}{\varrho_{1}\left(\varepsilon_{h}\right)}, \frac{x}{\varrho_{2}\left(\varepsilon_{h}\right)}, \nabla u_{j}^{(h)}(x)\right) \mathrm{d} x .
$$

Hence,

$$
\begin{equation*}
F^{* *, \mathrm{sc}}\left(u, \boldsymbol{\mu}_{1}, \boldsymbol{\mu}_{2}\right)+\delta \geqslant \lim _{h \rightarrow \infty} \lim _{j \rightarrow \infty} \int_{\Omega} f\left(\frac{x}{\varrho_{1}\left(\varepsilon_{h}\right)}, \frac{x}{\varrho_{2}\left(\varepsilon_{h}\right)}, \nabla u_{j}^{(h)}(x)\right) \mathrm{d} x \tag{4.3}
\end{equation*}
$$

and for all $\varphi \in C_{0}\left(\Omega ; C_{\#}\left(Y_{1} \times Y_{2} ; \mathbb{R}^{N}\right)\right)$,

$$
\begin{align*}
\lim _{h \rightarrow \infty} \lim _{j \rightarrow \infty} \int_{\Omega} \varphi\left(x, \frac{x}{\varrho_{1}\left(\varepsilon_{h}\right)}, \frac{x}{\varrho_{2}\left(\varepsilon_{h}\right)}\right) \cdot \nabla u_{j}^{(h)}(x) \mathrm{d} x & =\lim _{h \rightarrow \infty} \int_{\Omega} \varphi\left(x, \frac{x}{\varrho_{1}\left(\varepsilon_{h}\right)}, \frac{x}{\varrho_{2}\left(\varepsilon_{h}\right)}\right) \cdot \nabla u_{h}(x) \mathrm{d} x \\
& =\int_{\Omega \times Y_{1} \times Y_{2}} \varphi\left(x, y_{1}, y_{2}\right) \cdot \mathrm{d} \lambda_{u, \mu_{1}, \mu_{2}}\left(x, y_{1}, y_{2}\right) \tag{4.4}
\end{align*}
$$

Using a diagonalization argument and the separability of $C_{0}\left(\Omega ; C_{\#}\left(Y_{1} \times Y_{2} ; \mathbb{R}^{N}\right)\right)$, from (4.3), (4.4) and $(\mathcal{F} 4)^{\prime}$ we can find a sequence $\left\{j_{h}\right\}_{h \in \mathbb{N}}$ such that $j_{h} \rightarrow \infty$ as $h \rightarrow \infty, v_{h}:=u_{j_{h}}^{(h)} \in W^{1,1}(\Omega), \nabla v_{h} \mathcal{L}^{N}{ }_{\lfloor\Omega} \frac{3-s c}{\varepsilon_{h}} \lambda_{u, \mu_{1}, \mu_{2}}$ and

$$
F^{* *, \mathrm{sc}}\left(u, \boldsymbol{\mu}_{1}, \boldsymbol{\mu}_{2}\right)+\delta \geqslant \lim _{h \rightarrow \infty} \int_{\Omega} f\left(\frac{x}{\varrho_{1}\left(\varepsilon_{h}\right)}, \frac{x}{\varrho_{2}\left(\varepsilon_{h}\right)}, \nabla v_{h}(x)\right) \mathrm{d} x \geqslant F^{\mathrm{sc}}\left(u, \boldsymbol{\mu}_{1}, \boldsymbol{\mu}_{2}\right)
$$

where in the last inequality we used the definition of $F^{\mathrm{sc}}\left(u, \boldsymbol{\mu}_{1}, \boldsymbol{\mu}_{2}\right)$. Letting $\delta \rightarrow 0^{+}$, we conclude that $F^{* *, \mathrm{sc}}\left(u, \boldsymbol{\mu}_{1}, \boldsymbol{\mu}_{2}\right) \geqslant F^{\mathrm{sc}}\left(u, \boldsymbol{\mu}_{1}, \boldsymbol{\mu}_{2}\right)$.
The proof of inequality $F^{* *, h o m}(u) \geqslant F^{\text {hom }}(u)$ is similar. Thus, we conclude that $F^{* *, s c}\left(u, \boldsymbol{\mu}_{1}, \boldsymbol{\mu}_{2}\right)=$ $F^{\mathrm{sc}}\left(u, \boldsymbol{\mu}_{1}, \boldsymbol{\mu}_{2}\right)$ and $F^{* *, \text { hom }}(u)=F^{\mathrm{hom}}(u)$.

Substep 1.2. Finally, we observe that in view of Theorem 1.1 (i) and Lemma 4.1, we have that for all $\left(u, \boldsymbol{\mu}_{1}, \mu_{2}\right) \in B V(\Omega) \times \mathcal{M}_{\star}\left(\Omega ; B V_{\#}\left(Y_{1}\right)\right) \times \mathcal{M}_{\star}\left(\Omega \times Y_{1} ; B V_{\#}\left(Y_{2}\right)\right)$,

$$
\begin{aligned}
F^{* *, \mathrm{sc}}\left(u, \boldsymbol{\mu}_{1}, \boldsymbol{\mu}_{2}\right):= & \int_{\Omega \times Y_{1} \times Y_{2}} f^{* *}\left(y_{1}, y_{2}, \frac{\mathrm{~d} \lambda_{u, \boldsymbol{\mu}_{1}, \boldsymbol{\mu}_{2}}^{a c}}{\mathrm{~d} \mathcal{L}^{3 N}}\left(x, y_{1}, y_{2}\right)\right) \mathrm{d} x \mathrm{~d} y_{1} \mathrm{~d} y_{2} \\
& +\int_{\Omega \times Y_{1} \times Y_{2}}\left(f^{* *}\right)^{\infty}\left(y_{1}, y_{2}, \frac{\mathrm{~d} \lambda_{u, \boldsymbol{\mu}_{1}, \boldsymbol{\mu}_{2}}^{s}}{\mathrm{~d}\left\|\lambda_{u, \boldsymbol{\mu}_{1}, \boldsymbol{\mu}_{2}}^{s}\right\|}\left(x, y_{1}, y_{2}\right)\right) \mathrm{d}\left\|\lambda_{u, \boldsymbol{\mu}_{1}, \boldsymbol{\mu}_{2}}^{s}\right\|\left(x, y_{1}, y_{2}\right)
\end{aligned}
$$

and

$$
\begin{aligned}
F^{* *, \text { hom }}(u) & =\inf _{\substack{\mu_{1} \in \mathcal{M}_{\star}\left(\Omega ; B V_{\#}\left(Y_{1}\right)\right) \\
\boldsymbol{\mu}_{2} \in \mathcal{M}_{\star}\left(\Omega \times Y_{1} ; B V_{\#}\left(Y_{2}\right)\right)}} F^{* *, \mathrm{sc}}\left(u, \boldsymbol{\mu}_{1}, \boldsymbol{\mu}_{2}\right) \\
& =\int_{\Omega}\left(f^{* *}\right)_{\text {hom }}(\nabla u(x)) \mathrm{d} x+\int_{\Omega}\left(\left(f^{* *}\right)_{\text {hom }}\right)^{\infty}\left(\frac{\mathrm{d} D^{s} u}{\mathrm{~d}\left\|D^{s} u\right\|}(x)\right) \mathrm{d}\left\|D^{s} u\right\|(x)
\end{aligned}
$$

and this, together with Substep 1.1, completes the proof of Step 1.

## Step 2. We establish Corollary 1.2.

Fix $\eta>0$ (which, without loss of generality, we assume will take values on a sequence of positive numbers converging to zero), and let $F_{\eta}^{\mathrm{sc}}$ and $F_{\eta}^{\mathrm{hom}}$ be the functionals given by (1.4) and (1.5) for $d=1$, respectively, with $f$ replaced by $f_{\eta}$.
Assuming $(\mathcal{F} 6)$ with $o(1)$ replaced by $-|o(1)|$ in $(\mathcal{F} 6)$, it can be shown that we may use Step 1 for $f_{\eta}$. Thus, for every $\left(u, \mu_{1}, \boldsymbol{\mu}_{2}\right) \in B V(\Omega) \times \mathcal{M}_{\star}\left(\Omega ; B V_{\#}\left(Y_{1}\right)\right) \times \mathcal{M}_{\star}\left(\Omega \times Y_{1} ; B V_{\#}\left(Y_{2}\right)\right)$,

$$
\begin{align*}
F_{\eta}^{\mathrm{sc}}\left(u, \boldsymbol{\mu}_{1}, \boldsymbol{\mu}_{2}\right)= & \int_{\Omega \times Y_{1} \times Y_{2}}\left(f_{\eta}\right)^{* *}\left(y_{1}, y_{2}, \frac{\mathrm{~d} \lambda_{u, \boldsymbol{\mu}_{1}, \boldsymbol{\mu}_{2}}^{a c}}{\mathrm{~d} \mathcal{L}^{3 N}}\left(x, y_{1}, y_{2}\right)\right) \mathrm{d} x \mathrm{~d} y_{1} \mathrm{~d} y_{2}  \tag{4.5}\\
& +\int_{\Omega \times Y_{1} \times Y_{2}}\left(\left(f_{\eta}\right)^{* *}\right)^{\infty}\left(y_{1}, y_{2}, \frac{\mathrm{~d} \lambda_{u, \boldsymbol{\mu}_{1}, \boldsymbol{\mu}_{2}}^{s}}{\mathrm{~d}\left\|\lambda_{u, \boldsymbol{\mu}_{1}, \boldsymbol{\mu}_{2}}^{s}\right\|}\left(x, y_{1}, y_{2}\right)\right) \mathrm{d}\left\|\lambda_{u, \boldsymbol{\mu}_{1}, \boldsymbol{\mu}_{2}}^{s}\right\|\left(x, y_{1}, y_{2}\right)
\end{align*}
$$

and

$$
\begin{align*}
F_{\eta}^{\mathrm{hom}}(u) & =\inf _{\substack{\mu_{1} \in \mathcal{M}_{\star}\left(\Omega ; B V_{\neq}\left(Y_{1}\right)\right) \\
\mu_{2} \in \mathcal{M}_{\star}\left(\Omega \times Y_{1} ; B V_{\#}\left(Y_{2}\right)\right)}} F_{\eta}^{\mathrm{sc}}\left(u, \boldsymbol{\mu}_{1}, \boldsymbol{\mu}_{2}\right) \\
& =\int_{\Omega}\left(\left(f_{\eta}\right)^{* *}\right)_{\text {hom }}(\nabla u(x)) \mathrm{d} x+\int_{\Omega}\left(\left(\left(f_{\eta}\right)^{* *}\right)_{\text {hom }}\right)^{\infty}\left(\frac{\mathrm{d} D^{s} u}{\mathrm{~d}\left\|D^{s} u\right\|}(x)\right) \mathrm{d}\left\|D^{s} u\right\|(x) . \tag{4.6}
\end{align*}
$$

In order to pass (4.5) and (4.6) to the limit as $\eta \rightarrow 0^{+}$, we start by observing that for fixed $\left(u, \boldsymbol{\mu}_{1}, \boldsymbol{\mu}_{2}\right) \in B V(\Omega) \times \mathcal{M}_{\star}\left(\Omega ; B V_{\#}\left(Y_{1}\right)\right) \times \mathcal{M}_{\star}\left(\Omega \times Y_{1} ; B V_{\#}\left(Y_{2}\right)\right)$, the sequences $\left\{F_{\eta}^{\mathrm{sc}}\left(u, \boldsymbol{\mu}_{1}, \boldsymbol{\mu}_{2}\right)\right\}_{\eta>0}$ and $\left\{F_{\eta}^{\text {hom }}\left(u, \boldsymbol{\mu}_{1}, \boldsymbol{\mu}_{2}\right)\right\}_{\eta>0}$ are decreasing (as $\eta \rightarrow 0^{+}$), so that the respective limits as $\eta \rightarrow 0^{+}$exist and are given by the infimum in $\eta>0$.
Let $\left\{u_{\varepsilon}\right\}_{\varepsilon>0} \subset B V(\Omega)$ be such that $D u_{\varepsilon} \frac{3-s c}{\varepsilon} \lambda_{u, \mu_{1}, \mu_{2}}$. Then $\left\{D u_{\varepsilon}\right\}_{\varepsilon>0}$ is bounded in $\mathcal{M}\left(\Omega ; \mathbb{R}^{N}\right)$ (see Remark 2.5), and so since $\left(f_{\eta}\right)^{\infty}\left(y_{1}, y_{2}, \xi\right)=f^{\infty}\left(y_{1}, y_{2}, \xi\right)+\eta|\xi|$, we have

$$
F_{\eta}^{\mathrm{sc}}\left(u, \boldsymbol{\mu}_{1}, \boldsymbol{\mu}_{2}\right) \leqslant \liminf _{\varepsilon \rightarrow 0^{+}} F_{\varepsilon}\left(u_{\varepsilon}\right)+\eta C,
$$

where $C$ is a constant independent of $\varepsilon$. Letting $\eta \rightarrow 0^{+}$and then taking the infimum over all such sequences $\left\{u_{\varepsilon}\right\}_{\varepsilon>0}$, we conclude that $\lim _{\eta \rightarrow 0^{+}} F_{\eta}^{\mathrm{sc}}\left(u, \boldsymbol{\mu}_{1}, \boldsymbol{\mu}_{2}\right) \leqslant F^{\mathrm{sc}}\left(u, \boldsymbol{\mu}_{1}, \boldsymbol{\mu}_{2}\right)$. Conversely, since for all $\eta>0, f_{\eta} \geqslant f$, we have that $F_{\eta}^{\mathrm{sc}}\left(u, \boldsymbol{\mu}_{1}, \boldsymbol{\mu}_{2}\right) \geqslant F^{\mathrm{sc}}\left(u, \boldsymbol{\mu}_{1}, \boldsymbol{\mu}_{2}\right)$. Hence,

$$
\begin{equation*}
\lim _{\eta \rightarrow 0^{+}} F_{\eta}^{\mathrm{sc}}\left(u, \boldsymbol{\mu}_{1}, \boldsymbol{\mu}_{2}\right)=F^{\mathrm{sc}}\left(u, \boldsymbol{\mu}_{1}, \boldsymbol{\mu}_{2}\right) . \tag{4.7}
\end{equation*}
$$

Similar arguments ensure that

$$
\begin{equation*}
\lim _{\eta \rightarrow 0^{+}} F_{\eta}^{\mathrm{hom}}(u)=F^{\mathrm{hom}}(u) \tag{4.8}
\end{equation*}
$$

Moreover, as in (3.66),

$$
\begin{equation*}
\lim _{\eta \rightarrow 0^{+}} \inf _{\substack{\mu_{1} \in \mathcal{M}_{\star}\left(\Omega ; B V_{\#}\left(Y_{1} ; \mathbb{R}^{d}\right)\right) \\ \mu_{2} \in \mathcal{M}_{\star}\left(\Omega \times Y_{1} ; B V_{\#}\left(Y_{2} ; \mathbb{R}^{d}\right)\right)}} F_{\eta}^{\mathrm{sc}}\left(u, \boldsymbol{\mu}_{1}, \boldsymbol{\mu}_{2}\right)=\inf _{\substack{\mu_{1} \in \mathcal{M}_{\star}\left(\Omega ; B V_{\#}\left(Y_{1} ; \mathbb{R}^{d}\right)\right) \\ \mu_{2} \in \mathcal{M}_{\star}\left(\Omega \times Y_{1} ; B V_{\#}\left(Y_{2} ; \mathbb{R}^{d}\right)\right)}} F^{\mathrm{sc}}\left(u, \boldsymbol{\mu}_{1}, \boldsymbol{\mu}_{2}\right) . \tag{4.9}
\end{equation*}
$$

So, letting $\eta \rightarrow 0^{+}$in (4.5) and (4.6), thanks to (4.7), (4.8), (4.9), (2.31), (2.32), (2.36), (2.38) and Lebesgue Dominated Convergence Theorem together with $(\mathcal{F} 3)$ and $(\mathcal{F} 4)$, we obtain (1.9) and (1.10).
Finally, we observe that in view of Step 1 , if $f$ satisfies in addition $(\mathcal{F} 4)^{\prime}$, then

$$
\left(\left(f_{0^{+}}\right)^{* *}\right)^{\infty} \equiv\left(f^{* *}\right)^{\infty} \text { and }\left(\left(\left(f_{0^{+}}\right)^{* *}\right)_{\mathrm{hom}}\right)^{\infty} \equiv\left(\left(f^{* *}\right)_{\mathrm{hom}}\right)^{\infty}
$$

Moreover, if, in addition to $(\mathcal{F} 1),(\mathcal{F} 3),(\mathcal{F} 4),(\mathcal{F} 5)$ and $(\mathcal{F} 6)$, with $o(1)$ replaced by $-|o(1)|$ in $(\mathcal{F} 6)$, $f$ satisfies the condition $(\mathcal{F} 7)$, then by Proposition 2.9 (i)-b) and (ii)-c),

$$
\left(\left(f_{0^{+}}\right)^{* *}\right)^{\infty} \equiv\left(f^{\infty}\right)^{* *} \text { and }\left(\left(\left(f_{0^{+}}\right)^{* *}\right)_{\mathrm{hom}}\right)^{\infty} \equiv\left(\left(f^{\infty}\right)^{* *}\right)_{\mathrm{hom}} .
$$
