

## COMMUTATIVE ALGEBRA HW 15 SOLUTIONS

JC

Due in class Wed 19 October.

- (1) A topological space is called *discrete* if all subsets are open. Show that if  $R$  is Artinian then  $\text{Spec}(R)$  is discrete.

We know that if  $R$  is Artinian then  $\text{Spec}(R)$  is finite and also all points in it are maximal ideals. We saw in a previous HW that  $P$  is maximal iff  $\{P\}$  is closed, so in our case all points are closed. The set of closed sets is closed under finite unions and  $\text{Spec}(R)$  is finite so all sets are closed. Hence all sets are open and  $\text{Spec}(R)$  is discrete.

- (2) (A and M 6.4) Let  $M$  be a Noetherian  $R$ -module and let  $I$  be the *annihilator* of  $M$ , that is  $\{a : \forall m \ am = 0\}$ .

Show that  $R/I$  is a Noetherian ring.

(Thanks to George Schaeffer for this slick proof).

Let  $m_1, \dots, m_n$  generate  $M$ . We know that  $M^n$  is a Noetherian  $R$ -module (easy induction using the fact that for any  $R$ , if  $M \leq N$  then  $N$  is Noetherian iff both  $M$  and  $N/M$  are Noetherian). Consider the  $R$ -module HM from  $R$  to  $M^n$  given by  $r \mapsto (rm_1, \dots, rm_n)$ . The kernel is  $I$  so by the first IM thm  $R/I$  is IMic as an  $R$ -module to a submodule of  $M^n$ . So  $R/I$  is a Noetherian  $R$ -module. A little thought shows that this is equivalent to  $R/I$  being a Noetherian ring.

Show by example that  $R$  need not be Noetherian.

Let  $R$  be any non-Noetherian ring and  $M = 0$ .

- (3) Let  $R$  be a local Noetherian integral domain of dimension one.

Show that  $R$  has a unique nonzero prime ideal  $P$ , and that every ideal  $I \neq 0, R$  of  $R$  is  $P$ -primary.

Since  $R$  is an ID  $\{0\}$  is prime. For  $P$  any nonzero prime  $0 \subsetneq P$  must be a maximal chain of prime ideals, hence  $P$  is maximal, and so is equal to the unique maximal ideal.

Let  $I \neq 0, R$ . Then  $I$  is a finite intersection of nonzero primary ideals, which must all be  $P$ -primary as  $P$  is the only nonzero prime ideal, and hence  $I$  is  $P$ -primary.
