Homework 5  
Due: Monday, October 26

1. Prove that if  $u, v$  are the only vertices of odd degree in a graph  $G$ , then there is a path from  $u$  to  $v$  in  $G$ .

**Solution:** We have to show that  $u, v$  are in the same component of  $G$ . But if they are in different components,  $u \in C_1, v \in C_2$  then the sub-graph induced by  $C_1$  has one odd vertex,  $u$ . This contradicts the fact that every graph has an even number of vertices.

2. Let  $G = (V, E)$  be a graph with minimum degree at least three. Show that it contains a cycle of even length. (Hint: Consider a longest path).

**Solution:** Let  $P = (x = x_0, x_1, \dots, x_k)$  be a longest path in  $G$ . Let  $x_1, x_i, x_j, 1 < i < j$  be three neighbors of  $x$ . If  $i$  is odd then the cycle  $(x_0, x_1, \dots, x_i, x_0)$  has  $i + 1$  edges and is even and so we can assume that  $i, j$  are both even. But then the cycle  $(x_0, x_i, x_{i+1}, \dots, x_j, x_0)$  has  $j - i + 2$  edges and is even.

3. Prove that if  $T_1, T_2, \dots, T_k$  are pair-wise intersecting sub-trees of a tree  $T$ , then  $T$  has a vertex common to  $T_1, T_2, \dots, T_k$ . (Hint: use induction on  $k$ ).

**Solution:** Assume inductively that  $H = \bigcap_{i=1}^k T_i$  is non-empty.  $H$  must be a sub-tree of  $T$ , for if  $u, v \in H$  then each  $T_i$  contains the path from  $u$  to  $v$  in  $T$ . Now let  $\Gamma = T \setminus H$  be obtained by deleting the vertices of  $H$  from  $T$ . Let  $C_1, C_2, \dots, C_m$  be the components of  $\Gamma$ . Each  $C_i$  contains a unique vertex  $v_i$  that is adjacent to  $\Gamma$ . If  $C_1$  contained two such vertices  $u, u'$  then either the path from  $u$  to  $u'$  goes through  $\Gamma$  and then  $u, u'$  are in different components of  $\Gamma$  or it avoids  $\Gamma$  and then  $T$  contains a cycle, contradiction. Suppose now that  $T_{k+1}$  does not share a vertex with  $\Gamma$ . Then  $T_{k+1}$  must be contained in a single component  $C_1$ , say. For if  $T_{k+1}$  meets  $C_1$  and  $C_2$  then  $T_{k+1}$  must contain a path from  $C_1$  to  $C_2$  and this must go through  $\Gamma$ . We claim now that  $v_1$  belongs to  $T_1, T_2, \dots, T_{k+1}$ . Suppose that  $w \in C_1$  is in  $T_1$  and  $T_{k+1}$ . Then  $T_1$  contains a path from  $w$  to  $\Gamma$  and this goes through  $v_1$ . But then  $v_1 \in \Gamma$ , contradiction.
