## Selections and Binomial Coefficients

### Permutations

Let  $X$  be any fixed set of size  $n$  e.g.  $X = [n] = \{1, 2, \dots, n\}$ .

A *permutation* of  $X$  is a sequence of length  $n$  in which each element of  $X$  appears exactly once.

$p(n)$  denotes the number of permutations of  $X$ .

E.g.  $n = 3$ ,  $X = \{a, b, c\}$ .  $p(3) = 6$ .

$abc, acb, bac, bca, cab, cba,$

$$p(1) = 1$$

$$p(n) = np(n-1), \quad n \geq 2$$

$n$  choices for the first element  $x_1$ . For *each* choice of  $x_1$  there are  $p(n-1)$  ways of completing the sequence.

Thus

$$p(n) = n!.$$

+

+

### Ordered selection with repetition

$q(n, r)$  denotes the number of sequences of length  $r$  with elements from  $X$ .

E.g.  $n = 3$ ,  $r = 2$ ,  $X = \{a, b, c\}$ ,  $q(3, 2) = 9$ .

$aa, ab, ac, ba, bb, bc, ca, cb, cc.$

$$q(n, 0) = 1$$

$$q(n, r) = nq(n, r-1), \quad r \geq 1$$

So

$$q(n, r) = n^r.$$

+

3

+

4

### Ordered selection without repetition

$p(n, r)$  is the number of sequences of length  $r$  in which each element of  $X$  appears at most once.

E.g.  $n = 4$ ,  $r = 2$ ,  $X = \{a, b, c, d\}$ ,  $p(4, 2) = 12$ .

$ab, ac, ad, ba, bc, bd, ca, cb, cd, da, db, dc.$

$$p(n, 0) = 1$$

$$p(n, r) = np(n-1, r-1), \quad r \geq 1$$

$n$  choices for the first element  $x_1$ . For *each* choice of  $x_1$  there are  $p(n-1, r-1)$  ways of completing the sequence.

$$\begin{aligned} p(n, r) &= n(n-1) \cdots (n-r+1) \\ &= \frac{n!}{(n-r)!} \end{aligned}$$

+

2

+

+

### Unordered selection without repetition

What if the order of selection is immaterial?

$c(n, r)$  is the number of ways of choosing a set of  $r$  elements from  $[n]$ .

$$p(n, r) = r!c(n, r).$$

Each of the  $c(n, r)$  unordered choices of a set can be ordered in  $r!$  ways to make a sequence of length  $r$  from  $[n]$ .

$$c(n, r) = \binom{n}{r} = \frac{n!}{r!(n-r)!}$$

Here  $n! = 0$ ,  $n < 0$  and  $0! = 1$

+

+

+

+

### Unordered selection with repetition

$f(n, r)$  is the number of ways of choosing  $r$  elements from a set of size  $n$  where order does not matter and repetitions are allowed.

$$f(n, r) = \binom{n+r-1}{r}.$$

What if each element must be chosen at least once? If  $n = 3, k = 4$ :

$$\begin{aligned} 2R + 1B + 1W \\ 1R + 2B + 1W \\ 1R + 1B + 2W \end{aligned}$$

Let

$$\begin{aligned} X &= \{(x \in \{1, 2, \dots\}^n : x_1 + \dots + x_n = r)\} \\ X' &= \{x' \in \{0, 1, 2, \dots\}^n : x'_1 + \dots + x'_n = r - n\}. \end{aligned}$$

We claim that  $|X| = |X'| = \binom{r-1}{n-1}$ .

Consider  $f : X \rightarrow X'$  where

$$f(x_1, x_2, \dots, x_n) = (x_1 - 1, x_2 - 1, \dots, x_n - 1).$$

$f$  is a bijection with inverse  $g$

$$g(x'_1, x'_2, \dots, x'_n) = (x'_1 + 1, x'_2 + 1, \dots, x'_n + 1).$$

This implies

$$|X| = |X'| = \binom{n + (r - n) - 1}{n - 1} = \binom{r - 1}{n - 1}$$

+

+

### Summary of Selection

$S$  is a set of  $n$  distinct objects and we must choose  $r$  objects:

Order matters      No repetition allowed:  $P(n, r)$

Order matters      Repetition allowed:  $n^r$

Order does not matter      No repetition allowed:  $\binom{n}{r}$

Order does not matter      Repetition allowed:  $\binom{n+r-1}{r}$
