- 8.4. Convergence of the Binomial Model.
- (1) Let  $r_N > -1$ , and consider a bank that pays you interest  $r_N$  every 1/N time units.
- (2) Question: Can we choose  $r_N$  so that this converges as  $N \to \infty$ .
- (3) Let  $C_0^N = 1$ ,  $C_{n+1}^N = (1 + r_N)C_n^N$  and  $\underline{C_t} = \lim_{N \to \infty} C_{\lfloor Nt \rfloor}^N$ .

**Proposition 8.23.** If  $r \in \mathbb{R}$ ,  $r_N = r/N$ , then  $C_t = e^{rt}$ .

Remark 8.24. Note  $\partial_t C_t = rC_t$ . The quantity r is known as the continuously compounded interest rate.

Remark 8.25. If the interest rate is a constant r, then the discount factor is simply  $D_t = 1/C_t = e^{-rt}$ .

- (1) Now consider the N period Binomial model, with parameters  $0 < d_N < 1 + r_N < u_N$ , with stock price denoted by  $S_n^N$ . (2) Each time step for  $S^N$  denotes 1/N time units in real time. Can we chose  $u_N$ ,  $d_N$ ,  $r_N$  such that  $S_t = \lim_{N \to \infty} S_{\lfloor Nt \rfloor}^N$  exists?
- (3) Choose  $r_N = r/N$ , where  $r \in \mathbb{R}$  is the continuously compounded interest rate.

**Theorem 8.26.** Let u, d > 0 and choose

$$\underline{u_N} = 1 + \frac{r}{N} + \frac{u}{\sqrt{N}}, \qquad d_N = 1 + \frac{r}{N} - \frac{d}{\sqrt{N}}, \qquad \widetilde{p} = \frac{d}{u+d}, \qquad \widetilde{q} \neq \frac{u}{u+d}, \qquad \underline{\sigma}^2 = \widetilde{p}u^2 + \widetilde{q}d^2$$

 $\underline{u_N} = 1 + \frac{r}{N} + \frac{u}{\sqrt{N}} \,, \qquad \underline{d_N} = 1 + \frac{r}{N} - \frac{d}{\sqrt{N}} \,, \qquad \underbrace{\tilde{p}} = \frac{d}{u+d} \,, \qquad \underbrace{\tilde{q}} = \frac{u}{u+d} \,, \qquad \underline{\sigma^2 = \tilde{p}u^2 + \tilde{q}d^2} \,.$  Under the risk neutral measure, the processes  $S^N_{\lfloor Nt \rfloor}$  converge weakly to  $S_t = S_0 e^{(r-\sigma^2/2)t+\sigma W_t}$ , where  $\underline{W}$  is a Brownian motion. That is, for any bounded continuous function f,

$$\lim_{N \to \infty} \tilde{E}f(S_{\lfloor Nt \rfloor}^N) = \tilde{E}_{\bullet}f(S_t) = \tilde{E}f\left(S_0 \exp\left(\left(r - \frac{\sigma^2}{2}\right)t + \underline{\sigma}W_t\right)\right)$$

Remark 8.27.  $S_t$  above is called a Geometric Brownian motion with mean return rate r, and volatility  $\sigma$ .

Remark 8.28. The fact that we took the limit under the risk neutral measure is the reason the mean return rate r is the same as the interest rate r.

Remark 8.29. In this continuous time market you have the asset (whose price is denoted by  $(S_t)$ ), and a bank with continuously compounded interest rate r (i.e. discount factor is  $D_t = e^{-rt}$ ). You can trade continuously in time, and we are neglecting any transaction costs.

Note: RN prot of in the N period cire

 $\mathcal{F}_{N} = \frac{1 + \mathcal{F}_{N} - d_{N}}{d_{N} - d_{N}} = \frac{1 + \mathcal{F}_{N} \cdot \mathcal{F}_{N} - (1 + \mathcal{F}_{N} - d_{N})}{d_{N} - d_{N}}$

**Theorem 8.30.** Consider a security that pays  $f(S_T)$  at maturity time T. The arbitrage free price of this security at time t is given by $V_t = \frac{1}{D_t} \tilde{E}_t \left( D_T f(S_T) \right) = \tilde{E}_t \left( e^{-r(T-t)} f(S_T) \right)$   $Proof. \text{ For the Binomial model we already know } V_n^N = \frac{1}{D_n^N} \tilde{E}_n D_{\lfloor NT \rfloor}^N f(S_{\lfloor NT \rfloor}^N). \text{ Set } n = \lfloor Nt \rfloor \text{ and send } N \to \infty.$ 

$$V_t = \frac{1}{D_t} \tilde{\underline{E}}_t \left( \underline{D}_T \underline{f}(S_T) \right) = \tilde{\underline{E}}_t \left( e^{-r(T-t)} \underline{f}(S_T) \right)$$

**Theorem 8.31** (Black-Scholes formula). In the above market, a European call with maturity T and strike K pays  $(S_T - K)^+$  at time T. The arbitrage free price of this call at time t is  $c(t, S_t)$ , where

$$c(t,x) = xN(d_{+}(T-t,x)) - Ke^{-r(T-t)}N(d_{-}(T-t,x)),$$
 where  $d_{\pm} = \frac{1}{\sigma\sqrt{\tau}}\left(\ln\left(\frac{x}{K}\right) + \left(r \pm \frac{\sigma^{2}}{2}\right)\tau\right),$   $N(x) = \frac{1}{\sqrt{2\pi}}\int_{-\infty}^{x}e^{-y^{2}/2}dy.$ 

Proof. Let  $\tau = T - t$ . We know  $c(t, S(t)) = \tilde{E}_t e^{-r_{\mathcal{I}}} (S_T - K)^+$ . Observe first

$$S_t = S_0 e^{(r - \frac{\sigma^2}{2})\underline{t} + \sigma W_t}, \quad S_T = S_0 e^{(r - \frac{\sigma^2}{2})\underline{T} + \sigma W_T}, \quad \Longrightarrow \quad S_T = S_t e^{(r - \frac{\sigma^2}{2})\underline{\tau} + \sigma (W_T - W_T)},$$

Since  $W_T - W_t$  is independent of  $\mathcal{F}_t$ , and  $S_t$  is  $\mathcal{F}_t$  measurable, by the independence lemma

Since 
$$W_T - W_t$$
 is independent of  $\mathcal{F}_t$ , and  $S_t$  is  $\mathcal{F}_t$  measurable, by the independence lemma,

Since 
$$W_T - W_t$$
 is independent of  $\mathcal{F}_t$ , and  $S_t$  is  $\mathcal{F}_t$  measurable, by the independence lemma

$$\underline{c(t,S_t)} = \tilde{\boldsymbol{E}}_t e^{-r\tau} (\underline{S_t} e^{(r-\frac{\sigma^2}{2})\tau + \sigma(W_T - W_t)} - \underline{K})^+ = \int_{\mathbb{R}} e^{-r\tau} (\underline{S_t} e^{(r-\frac{\sigma^2}{2})\tau + \sigma\sqrt{\tau}y} - K)^+ e^{-y^2/2} \frac{dy}{\sqrt{2\pi}}.$$

Now set 
$$S_t = r$$

Now set 
$$S_t = \underline{x}$$
,

Now set 
$$S_t = x$$
,

$$d_{\pm}(\tau, x) \stackrel{\text{def}}{=} \frac{1}{\sigma \sqrt{\tau}} \left( \ln\left(\frac{x}{K}\right) + \left(r \pm \frac{\sigma^2}{2}\right) \tau \right), \quad N(x) = \frac{1}{\sqrt{2\pi}} \int_{-\infty}^{x} e^{-y^2/2} \, dy = \frac{1}{\sqrt{2\pi}} \int_{-x}^{\infty} e^{-y^2/2} \, dy,$$

$$c(t,x) = \frac{1}{\sqrt{2\pi}} \int_{-d_{-}}^{\infty} x \exp\left(\frac{-\sigma^{2}\tau}{2} + \sigma\sqrt{\tau}y - \frac{y^{2}}{2}\right) dy - e^{-r\tau}KN(d_{-})$$

$$= \frac{1}{\sqrt{2\pi}} \int_{-d}^{\infty} x \exp\left(\frac{-(y - \sigma\sqrt{\tau})^{2}}{2}\right) dy - e^{-r\tau}KN(d_{-}) = xN(d_{+}) - e^{-r\tau}KN(d_{-}).$$

$$W_{T} - W_{t} \sim N(0, T - t) \qquad W_{T} - W_{t} = \sqrt{T} \cdot \left( \frac{W_{T} - W_{t}}{\sqrt{T} - t} \right)$$

$$W_{T} - W_{t} \sim N(0, 1) \qquad N(0, 1)$$

$$W_{T} - W_{t} = \sqrt{T} \cdot \left( \frac{W_{T} - W_{t}}{\sqrt{T} - t} \right)$$

$$N(0, 1)$$
