**Putnam 1995/A4.** Suppose we have a necklace of n beads. Each bead is labeled with an integer and the sum of all these labels is n-1. Prove that we can cut the necklace to form a string whose consecutive labels  $x_1, x_2, \ldots, x_n$  satisfy

$$\sum_{i=1}^{k} x_i \le k - 1 \quad \text{for} \quad k = 1, 2, \dots, n.$$

**Putnam 1995/A5.** Let  $x_1, x_2, \ldots, x_n$  be differentiable (real-valued) functions of a single variable t which satisfy

for some constants  $a_{ij} > 0$ . Suppose that for all  $i, x_i(t) \to 0$  as  $t \to \infty$ . Are the functions  $x_1, x_2, \ldots, x_n$  necessarily linearly dependent?

**Putnam 1995/A6.** Suppose that each of n people writes down the numbers 1,2,3 in random order in one column of a  $3 \times n$  matrix, with all orders equally likely and with the orders for different columns independent of each other. Let the row sums a, b, c of the resulting matrix be rearranged (if necessary) so that  $a \le b \le c$ . Show that for some  $n \ge 1995$ , it is at least four times as likely that both b = a + 1 and c = a + 2 as that a = b = c.
