## 1 Problems

Putnam 2003/A4. Suppose that $a, b, c, A, B, C$ are real numbers, $a \neq 0$ and $A \neq 0$, such that

$$
\left|a x^{2}+b x+c\right| \leq\left|A x^{2}+B x+C\right|
$$

for all real numbers $x$. Show that

$$
\left|b^{2}-4 a c\right| \leq\left|B^{2}-4 A C\right|
$$

Putnam 2003/A5. A Dyck $n$-path is a lattice path of $n$ upsteps $(1,1)$ and $n$ downsteps $(1,-1)$ that starts at the origin $O$ and never dips below the $x$-axis. A return is a maximal sequence of contiguous downsteps that terminates on the $x$-axis. For example, the Dyck 5 -path illustrated has two returns, of length 3 and 1 respectively.

Show that there is a one-to-one correspondence between the Dyck $n$-paths with no return of even length and the Dyck ( $n-1$ )-paths.

Putnam 2003/A6. For a set $S$ of non-negative integers, let $r_{S}(n)$ denote the number of ordered pairs $\left(s_{1}, s_{2}\right)$ such that $s_{1} \in S, s_{2} \in S, s_{1} \neq s_{2}$, and $s_{1}+s_{2}=n$. Is it possible to partition the non-negative integers into two sets $A$ and $B$ in such a way that $r_{A}(n)=r_{B}(n)$ for all $n$ ?
