## 1 Problems

Putnam 2007/A4. A repunit is a positive integer whose digits in base 10 are all ones. Find all polynomials $f$ with real coefficients such that if $n$ is a repunit, then so is $f(n)$.

Putnam 2007/A5. Suppose that a finite group has exactly $n$ elements of order $p$, where $p$ is a prime. Prove that either $n=0$ or $p$ divides $n+1$.

Putnam 2007/A6. A triangulation $\mathcal{T}$ of a polygon $P$ is a finite collection of triangles whose union is $P$, and such that the intersection of any two triangles is either empty, or a shared vertex, or a shared side. Moreover, each side is a side of exactly one triangle in $\mathcal{T}$. Say that $\mathcal{T}$ is admissible if every internal vertex is shared by 6 or more triangles. Prove that there is an integer $M_{n}$, depending only on $n$, such that any admissible triangulation of a polygon $P$ with $n$ sides has at most $M_{n}$ triangles.
