### Problem ("Chomp")

Two players play a game on an  $m \times n$  chocolate bar made up of small squares. The players take turns choosing a square and eating it, together with all the squares below it and to the right. The top left square is poisoned: the player who eats it, loses.

▲ロト ▲冊 ト ▲ ヨ ト ▲ ヨ ト ● の へ ()

- 1. Show that the first player has a winning strategy.
- 2. Find this winning strategy in the case m = n.

This is a strategy-stealing argument:

シック・ 川 ・山・山・山・ 一日・

This is a strategy-stealing argument:

		$\overline{X}$

(日本)(日本)(日本)(日本)(日本)(日本)

This is a strategy-stealing argument:

・ロト ・ 日 ・ ・ 田 ト ・ 田 ト ・ 日 ・ つ へ ()・

This is a strategy-stealing argument:

### Problem (Unknown source)

A box contains 300 matches. Two players take turns taking some matches from the box; each player must take at least one match, but no more than half the matches. The player who cannot move, loses. Who has the winning strategy?

#### Problem (German Math Olympiad 1984/1.)

Two players take turns writing a number 1, 2, ..., 6 on the board. When 2n numbers have been written, the game ends; the second player wins if the sum of the numbers is divisible by 9. For which values of n does the second player have a winning strategy?

### Problem (Putnam 1993/B2.)

Cards numbered  $1, \ldots, 2n$  are shuffled and dealt to two players (each receives n cards). The players take turns discarding a card face-up; if the sum of all discarded cards is divisible by 2n + 1, the game ends and the player who just discarded, wins.

Assuming optimal play, who wins and how?

#### Problem (New Zealand IMO Selection, 2004.)

The numbers 1, ..., 1000 are written on the board. Two players take turns erasing a number; a number x may be erased if x = 1, or x - 1 has been erased, or x is even and  $\frac{x}{2}$  has been erased. The player to erase 1000 wins.

Which player has a winning strategy?

#### Problem (ARML 1998 Power Round)

Allie and Bob play a game constructing a partition

 $n = a_1 + a_2 + \cdots + a_k \quad s.t. \ a_1 \ge a_2 \ge \cdots \ge a_k \ge 1.$ 

On the *i*-th turn, a player picks  $a_i$  such that  $a_i \leq a_{i-1}$  and  $a_1 + \cdots + a_i \leq n$ . Allie goes first but cannot pick n.

The player to write down  $a_k$  so that  $a_1 + \cdots + a_k = n$ , wins.

- For which n does Bob have a winning strategy?
- Suppose instead of a<sub>i</sub> ≤ a<sub>i-1</sub> the condition is a<sub>i</sub> ≤ 2a<sub>i-1</sub>. For which n does Bob have a winning strategy?
