

RAINBOW HAMILTON CYCLES

Po-Shen Loh

Carnegie Mellon University

Joint work with Alan Frieze

DEFINITION

A cycle is *Hamiltonian* if it visits every vertex exactly once.

DEFINITION

A cycle is *Hamiltonian* if it visits every vertex exactly once.

DEFINITION

Erdős-Rényi $G_{n,p}$: edges appear independently with probability p .

DEFINITION

A cycle is *Hamiltonian* if it visits every vertex exactly once.

DEFINITION

Erdős-Rényi $G_{n,p}$: edges appear independently with probability p .

- (Komlós, Szemerédi; Bollobás) $G_{n,p}$ is Hamiltonian **whp** if $p = \frac{\log n + \log \log n + \omega(n)}{n}$ with $\omega(n) \rightarrow \infty$.

DEFINITION

A cycle is *Hamiltonian* if it visits every vertex exactly once.

DEFINITION

Erdős-Rényi $G_{n,p}$: edges appear independently with probability p .

- (Komlós, Szemerédi; Bollobás) $G_{n,p}$ is Hamiltonian **whp** if $p = \frac{\log n + \log \log n + \omega(n)}{n}$ with $\omega(n) \rightarrow \infty$.
- (Robinson, Wormald) $G_{3\text{-reg}}$ is Hamiltonian **whp**.

DEFINITION

A cycle is *Hamiltonian* if it visits every vertex exactly once.

DEFINITION

Erdős-Rényi $G_{n,p}$: edges appear independently with probability p .

- (Komlós, Szemerédi; Bollobás) $G_{n,p}$ is Hamiltonian **whp** if $p = \frac{\log n + \log \log n + \omega(n)}{n}$ with $\omega(n) \rightarrow \infty$.
- (Robinson, Wormald) $G_{3\text{-reg}}$ is Hamiltonian **whp**.
- (Bohman, Frieze) $G_{3\text{-out}}$ is Hamiltonian **whp**.

DEFINITION

A cycle is *Hamiltonian* if it visits every vertex exactly once.

DEFINITION

Erdős-Rényi $G_{n,p}$: edges appear independently with probability p .

$H_{n,p;3}$: each triple appears independently with probability p .

Tight H-cycle

Loose H-cycle

DEFINITION (3-UNIFORM HYPERGRAPH)

$H_{n,p;3}$: each triple appears independently with probability p .

Tight H-cycle

Loose H-cycle

- (Frieze) $H_{n,p;3}$ has loose H-cycle **whp** if $p > \frac{K \log n}{n^2}$, $4 \mid n$.

DEFINITION (3-UNIFORM HYPERGRAPH)

$H_{n,p;3}$: each triple appears independently with probability p .

Tight H-cycle

Loose H-cycle

- (Frieze) $H_{n,p;3}$ has loose H-cycle **whp** if $p > \frac{K \log n}{n^2}$, $4 \mid n$.
- (Dudek, Frieze) Asymptotically answered for all uniformities, and all degrees of loose-ness.

QUESTION

Does $G_{n,p}$ have a rainbow Hamilton cycle if edges are randomly colored from κ colors?

RAINBOW HAMILTON CYCLES

QUESTION

Does $G_{n,p}$ have a rainbow Hamilton cycle if edges are randomly colored from κ colors?

OBSERVATIONS

- Must have $p > \frac{\log n + \log \log n + \omega(n)}{n}$ with $\omega(n) \rightarrow \infty$.
- Must have $\kappa \geq n$.

RAINBOW HAMILTON CYCLES

QUESTION

Does $G_{n,p}$ have a rainbow Hamilton cycle if edges are randomly colored from κ colors?

OBSERVATIONS

- Must have $p > \frac{\log n + \log \log n + \omega(n)}{n}$ with $\omega(n) \rightarrow \infty$.
- Must have $\kappa \geq n$.
- (Cooper, Frieze) True if $p = \frac{20 \log n}{n}$ and $\kappa = 20n$.

QUESTION

Does $G_{n,p}$ have a rainbow Hamilton cycle if edges are randomly colored from κ colors?

OBSERVATIONS

- Must have $p > \frac{\log n + \log \log n + \omega(n)}{n}$ with $\omega(n) \rightarrow \infty$.
- Must have $\kappa \geq n$.
- (Cooper, Frieze) True if $p = \frac{20 \log n}{n}$ and $\kappa = 20n$.
- (Janson, Wormald) True if $G_{2r\text{-reg}}$ is randomly colored with each of $\kappa = n$ colors appearing exactly $r \geq 4$ times.

LOOSE VS. RAINBOW H-CYCLES

- Connect 3-uniform hypergraphs to colored graphs

LOOSE VS. RAINBOW H-CYCLES

- Connect 3-uniform hypergraphs to colored graphs.

Hypergraph
(bisected vertex set)

LOOSE VS. RAINBOW H-CYCLES

- Connect 3-uniform hypergraphs to colored graphs.

Hypergraph
(bisected vertex set)

LOOSE VS. RAINBOW H-CYCLES

- Connect 3-uniform hypergraphs to colored graphs.

LOOSE VS. RAINBOW H-CYCLES

- Connect 3-uniform hypergraphs (loose Hamiltonicity) to colored graphs (rainbow Hamilton cycles).

LOOSE VS. RAINBOW H-CYCLES

- Connect 3-uniform hypergraphs (loose Hamiltonicity) to colored graphs (rainbow Hamilton cycles).

- Frieze applied Johansson-Kahn-Vu to find perfect matchings.
- Apply Janson-Wormald to find rainbow H-cycle in randomly colored random regular graph.

THEOREM (FRIEZE, L.)

For any fixed $\epsilon > 0$, if $p = \frac{(1+\epsilon)\log n}{n}$, then $G_{n,p}$ contains a rainbow Hamilton cycle **whp** when its edges are randomly colored from $\kappa = (1 + \epsilon)n$ colors.

Remarks:

- Asymptotically best possible, both in terms of p and κ .
- Still holds when ϵ tends (slowly) to zero.

OBSERVATION

If $p = \frac{(1+\epsilon)\log n}{n}$, then almost all vertices have degree $\geq \frac{1}{10} \log n$.

OBSERVATION

If $p = \frac{(1+\epsilon)\log n}{n}$, then almost all vertices have degree $\geq \frac{1}{10} \log n$.

Justification:

- Degree of fixed vertex is $\text{Bin}[n-1, p]$; expectation $\sim \log n$

OBSERVATION

If $p = \frac{(1+\epsilon)\log n}{n}$, then almost all vertices have degree $\geq \frac{1}{10} \log n$.

Justification:

- Degree of fixed vertex is $\text{Bin}[n-1, p]$; expectation $\sim \log n$
- By Chernoff, $\mathbb{P}[\deg(v) < \frac{1}{10}\mathbb{E}] < e^{-\frac{2}{3}\mathbb{E}} = n^{-\frac{2}{3}}$.

OBSERVATION

If $p = \frac{(1+\epsilon)\log n}{n}$, then almost all vertices have degree $\geq \frac{1}{10} \log n$.

Justification:

- Degree of fixed vertex is $\text{Bin}[n-1, p]$; expectation $\sim \log n$
- By Chernoff, $\mathbb{P}[\deg(v) < \frac{1}{10}\mathbb{E}] < e^{-\frac{2}{3}\mathbb{E}} = n^{-\frac{2}{3}}$.
- Typically, all but $< \sqrt[3]{n}$ vertices have degree $\geq \frac{1}{10} \log n$. $\square$

OBSERVATION

If $p = \frac{(1+\epsilon)\log n}{n}$, then almost all vertices have degree $\geq \frac{1}{10} \log n$.

First attempt to find rainbow H-cycle:

- Suppose all degrees $\geq \frac{1}{10} \log n$.
- At each vertex, expose list of colors that appear.

OBSERVATION

If $p = \frac{(1+\epsilon)\log n}{n}$, then almost all vertices have degree $\geq \frac{1}{10} \log n$.

First attempt to find rainbow H-cycle:

- Suppose all degrees $\geq \frac{1}{10} \log n$.
- At each vertex, expose list of colors that appear.

- Select 3 colors per vertex s.t. all selected colors are different.

OBSERVATION

If $p = \frac{(1+\epsilon)\log n}{n}$, then almost all vertices have degree $\geq \frac{1}{10} \log n$.

First attempt to find rainbow H-cycle:

- Suppose all degrees $\geq \frac{1}{10} \log n$.
- At each vertex, expose list of colors that appear.

- Select 3 colors per vertex s.t. all selected colors are different.

OBSERVATION

If $p = \frac{(1+\epsilon)\log n}{n}$, then almost all vertices have degree $\geq \frac{1}{10} \log n$.

First attempt to find rainbow H-cycle:

- Suppose all degrees $\geq \frac{1}{10} \log n$.
- At each vertex, expose list of colors that appear.

- Select 3 colors per vertex s.t. all selected colors are different.
- Expose those edges only; like $G_{3\text{-out}}$.

OBSERVATION

If $p = \frac{(1+\epsilon) \log n}{n}$, then almost all vertices have degree $\geq \frac{1}{10} \log n$.

First attempt to find rainbow H-cycle:

- Suppose all degrees $\geq \frac{1}{10} \log n$.
- At each vertex, expose list of colors that appear.

- Select 3 colors per vertex s.t. all selected colors are different.
- Expose those edges only; like $G_{3\text{-out}}$.

OBSERVATION

If $p = \frac{(1+\epsilon)\log n}{n}$, then almost all vertices have degree $\geq \frac{1}{10} \log n$.

First attempt to find rainbow H-cycle:

- Suppose all degrees $\geq \frac{1}{10} \log n$.
- At each vertex, expose list of colors that appear.

- Select 3 colors per vertex s.t. all selected colors are different.
- Expose those edges only; like $G_{3\text{-out}}$.

Already requires $3n$ colors.

SAVING THE CONSTANT FACTOR

SPRINKLING

Reserve $p' = \frac{\epsilon}{2} \cdot \frac{\log n}{n}$ and $\kappa' = \frac{\epsilon n}{2}$ for 2nd phase.

SAVING THE CONSTANT FACTOR

SPRINKLING

Reserve $p' = \frac{\epsilon}{2} \cdot \frac{\log n}{n}$ and $\kappa' = \frac{\epsilon n}{2}$ for 2nd phase.

MAIN LEMMA

Using only edges and colors from Phase 1, there is a partition into rainbow intervals, such that:

- All intervals have length $L = \frac{14}{\epsilon}$.

SAVING THE CONSTANT FACTOR

SPRINKLING

Reserve $p' = \frac{\epsilon}{2} \cdot \frac{\log n}{n}$ and $\kappa' = \frac{\epsilon n}{2}$ for 2nd phase.

MAIN LEMMA

Using only edges and colors from Phase 1, there is a partition into rainbow intervals, such that:

- All intervals have length $L = \frac{14}{\epsilon}$.
- Each A -vertex has $\geq \frac{\epsilon^2}{40L} \log n$ B -neighbors in Phase 2.
- Each B -vertex has $\geq \frac{\epsilon^2}{40L} \log n$ A -neighbors in Phase 2.

FINAL RAINBOW LINKING

- Expose Phase 2 colors between A - and B -vertices.
- Select 2 colors per vertex s.t. all selected colors are different.

FINAL RAINBOW LINKING

- Expose Phase 2 colors between A - and B -vertices.
- Select 2 colors per vertex s.t. all selected colors are different.
- Now only requires $2 \cdot \frac{2n}{L} = \frac{2}{7}\epsilon n$ colors, out of Phase 2's $\frac{\epsilon n}{2}$.

FINAL RAINBOW LINKING

- Expose Phase 2 colors between A - and B -vertices.
- Select 2 colors per vertex s.t. all selected colors are different.
- Now only requires $2 \cdot \frac{2n}{L} = \frac{2}{7}\epsilon n$ colors, out of Phase 2's $\frac{\epsilon n}{2}$.

FINAL RAINBOW LINKING

- Expose Phase 2 colors between A - and B -vertices.
- Select 2 colors per vertex s.t. all selected colors are different.
- Now only requires $2 \cdot \frac{2n}{L} = \frac{2}{7}\epsilon n$ colors, out of Phase 2's $\frac{\epsilon n}{2}$.

- Aux. digraph: vertices are intervals; edges oriented $B \rightarrow A$.
- Directed H-cycle in $D_{2\text{-in},2\text{-out}}$ links all intervals via Phase 2. $\square$

THEOREM (AJTAI, KOMLÓS, SZEMERÉDI; DE LA VEGA)

Let $p = \frac{\omega}{n}$, where $0 < \omega < \log n - 3 \log \log n$. Then $G_{n,p}$ has a path of length $(1 - \frac{1}{\omega})n$ **whp**.

THEOREM (AJTAI, KOMLÓS, SZEMERÉDI; DE LA VEGA)

Let $p = \frac{\omega}{n}$, where $0 < \omega < \log n - 3 \log \log n$. Then $G_{n,p}$ has a path of length $(1 - \frac{1}{\omega})n$ **whp**.

To obtain intervals:

- Adapting proof of de la Vega, find rainbow path of length $n - o(n)$ in Phase 1.
- Break the long path into intervals of length $L = \frac{14}{\epsilon}$.

THEOREM (AJTAI, KOMLÓS, SZEMERÉDI; DE LA VEGA)

Let $p = \frac{\omega}{n}$, where $0 < \omega < \log n - 3 \log \log n$. Then $G_{n,p}$ has a path of length $(1 - \frac{1}{\omega})n$ **whp**.

To obtain intervals:

- Adapting proof of de la Vega, find rainbow path of length $n - o(n)$ in Phase 1.
- Break the long path into intervals of length $L = \frac{14}{\epsilon}$.
- Absorb all missing vertices into system of intervals, using minimum degree two.

THEOREM (FRIEZE, L.)

For any fixed $\epsilon > 0$, if $p = \frac{(1+\epsilon)\log n}{n}$, then $G_{n,p}$ contains a rainbow Hamilton cycle **whp** when its edges are randomly colored from $\kappa = (1 + \epsilon)n$ colors.

THEOREM (FRIEZE, L.)

For any fixed $\epsilon > 0$, if $p = \frac{(1+\epsilon)\log n}{n}$, then $G_{n,p}$ contains a rainbow Hamilton cycle **whp** when its edges are randomly colored from $\kappa = (1 + \epsilon)n$ colors.

Edge-colored random graph process:

- Start with n isolated vertices.
- Each round, add a new edge, selected uniformly at random from all missing edges.
- Randomly color the new edge from a set C of size at least n .

CONCLUSION

THEOREM (FRIEZE, L.)

For any fixed $\epsilon > 0$, if $p = \frac{(1+\epsilon)\log n}{n}$, then $G_{n,p}$ contains a rainbow Hamilton cycle **whp** when its edges are randomly colored from $\kappa = (1 + \epsilon)n$ colors.

Edge-colored random graph process:

- Start with n isolated vertices.
- Each round, add a new edge, selected uniformly at random from all missing edges.
- Randomly color the new edge from a set C of size at least n .

QUESTION

Does a rainbow Hamilton cycle appear as soon as the minimum degree is at least two and at least n colors have arrived?
