

A Course in Model Theory III:

Classification Theory for Abstract Elementary Classes

Rami Grossberg¹

DEPARTMENT OF MATHEMATICAL SCIENCES, CARNEGIE MELLON UNIVERSITY, PITTSBURGH, PA 15213

Contents

Preface	7
Introduction	9
Chapter 1. Abstract Elementary Classes	13
Introduction	13
1. Abstract classes	13
2. Abstract Elementary Classes	19
Chapter 2. Some extensions of first-order logic	27
Introduction	27
1. $L_{\omega_1, \omega}$ and examples	27
2. Scott's theorem	31
3. The logics $L_{\infty, \mu}$, $L_{\lambda, \kappa}$ and $L_{\omega_1, \omega}(\mathbf{Q})$	33
Chapter 3. Completeness and omitting types theorems for $L_{\omega_1, \omega}(\mathbf{Q})$	47
Introduction	47
Chapter 4. PC-classes and Hanf numbers	49
introduction	49
1. Silver's example	50
2. Morley's computation of the Hanf number	51
3. Shelah's Generalization of Ehrenfeucht-Mostowski models	58
Chapter 5. Abstract elementary classes are PC-classes	63
Preliminaries	63
1. Skolem Functions in Abstract Elementary Classes	64
Chapter 6. Galois types and saturation	69
Introduction	69
1. Types in Abstract Elementary Classes	70
2. Galois saturation and model-homogeneity are the same	74
3. Existence and uniqueness of model homogenous models	78
4. Limit models	81
Chapter 7. Getting amalgamation	85
Introduction	85
1. An amusing proof	85
2. universal models	86
3. Weaker forms of amalgamation	88
4. Few models imply the amalgamation property	89
5. On the function $\lambda \mapsto \text{IE}(\lambda, \mathcal{K})$	93
Chapter 8. Existence in \mathcal{K}_{λ^+}	97
Introduction	97
1. The extension property for pre-types	98

2. No models in λ^{++} make models in λ^+ fat	102
3. Various extension properties	104
4. Not having maximal models is cool too	104
Chapter 9. Minimal and reduced types	107
Introduction	107
1. Direct limits of models and Galois types	108
2. Existence of minimal types in K_λ^3 assuming $K_{\lambda+3} = \emptyset$ and more	112
3. Existence of minimal types in K_λ^3 assuming Galois-stability and amalgamation	114
4. Galois stability and non-splitting	116
5. Using realizations of minimal types as a test of saturation	118
Chapter 10. The effect of assuming categoricity in $\lambda \geq \text{Hanf}(\mathcal{K})$	123
Introduction	123
1. μ -Galois satbility for all $\mu < \lambda$	123
2. Density of amalgamation bases	125
3. Vaughtian Pairs	126
Chapter 11. Uniqueness of limit models for AECs with amalgamation AECs	127
Introduction	127
1. The array	127
2. Strong types	127
Chapter 12. Tameness	129
Introduction	129
1. μ -Galois tameness for all $\mu < \lambda$	129
2. Stability spectrum for tame AECs	129
Chapter 13. Shelah's categoricity conjecture is true for Tame AECs	131
Introduction	131
Chapter 14. Frames $\langle \mathcal{K}, \downarrow \rangle$	133
Introduction	133
1. A sufficient condition for tameness	133
Chapter 15. Excellent classes	135
Introduction	135
1. The basic framework and concepts	144
2. Examples and applications	149
3. Good sets	149
4. Basic stability of the class of atomic models	149
5. Transferring results up and down	150
6. Categoricity	150
7. Non-excellence gives many models	150
Chapter 16. Homogenous model theory	151
Introduction	151
Chapter 17. Sufficient condition for tameness	153
Introduction	153
1. Weak forking	153
2. Non-uniqueness property	153
3. Excellence implies tameness	153
Chapter 18. Examples	155

Introduction	155
1. The random bi-partite graph	156
2. An AEC categorical in λ^{+n} but not in λ^{+n+1}	157
Chapter 19. Open Problems	159
Introduction	159
1. Shelah's categoricity conjecture	159
2. Main Gap for uncountable theories	159
3. Other problems	160
Appendix(s)	163
Appendix A. The filter of closed unbounded sets	165
Introduction	165
1. Definitions and basics	165
2. Fodor's and Ulam Theorems	169
3. Kueker's filter	174
Appendix B. Models of weak set theory	175
Introduction	175
1. Transitive models	176
Appendix C. Weak diamond	183
1. Introduction	183
2. On diamonds	183
3. The small subsets of λ^+ is a normal ideal	190
4. The building-stones of many models	193
Appendix D. Historical remarks	197
Appendix. Bibliography	199
Appendix. Index	203
